Subject: Modifying RadioShack 2m amp

Hi everybody,

I looked into my Radio Shack 2m amp (HTA-20) and saw a couple of

poti's or something like that (couldn't tell the difference) with a

drop of blue glue on them. Could those be changed so the amp can be

used outside of 144-148 MHz? If yes, how?

Thanks ahead,

Timo

From: "DavidC" <davidc@bit-net.com>

Subject: Need Help With Overdrive Protection

I am well along the path to building my 1KW 160-6m

solid state amp. I want to defend the finals (a pair of

MRF154's) with an input circuit to limit potential overdrive.

I see two options:

1. Use a 100W (4dB) pad which I understand will divide

whatever the input power is by 4 and send 3/4 of it into a

dummy load and 1/4 to the amp. That way with 100 watts

of drive the amp. only sees about 25 watts.

25 watts should give full power. Pieter N4IP who has built

one of these (see: http://www.ibelings.com/n4ip/sskw/
) says

he has accidently keyed 100W into his amp on multiple

occasions and nothing blew up. He says the MRF154/157

transistors are very rugged.

2. A peak power detector that feeds a voltage to a circuit

that trips the COR if the 25 watt drive threshold is exceeded.

Option 2 is better because I can run the drive rig at lower

output thus extending the life of that rig. Option 1 is simpler
...

I am seeking your advice and your favorite circuit(s) to

accomplish either or both.

Thanks! & 73, DavidC K1YP@qsl.net

Mark: I don't know about Bill, but I had my Yaesu
890 converted to the

pin_diode mode by KK7TV. He is a factory authorized fixer of Icoms
also, so

you might want to check him out. He has a web site, but due to a MAJOR

cockpit error, I don't have a URL handy. While the actual reduction
in noise

floor can be measured, I'm quite satisfied with the warm_and _fuzzy
feeling

that I get from having the mode done! When I save up the coins, I'll send

him my 990 to have the diodes replaced in it.

This makes me wonder why you bothered buying it in the first place then

.

Date: Sun, 16 May 1999 10:14:05 -0400

From: "E-Mail" <w3yb@erols.com>

Subject: YAESU VX5R and Accessories

I have the following I will sell to be best reasonable offer:

1. VX5R Transceiver Serial Number 8L010387, unmodified
in any way, new

condition, box, warranty card, purchase receipt.

2. Yaesu Soft Case CSC-73.

3. Diamond SRH-519 144/430 MHZ SMA antenna. On 144
and 430 MHZ, this is

far superior to the supplied antenna. It is very flexible.

4. E-DC-6 Power Cable, connected to cigarette lighter
plug with LED, with

3A fuse (installed inside plug). This allows for radio operation at full

power while plugged into the automobile cigarette lighter.

5. Pryme SPM-100 Speaker-Mike. This is far better than the Yaesu

Speaker-Mike (in my opinion).

6. Yaesu CD-15 drop in battery charger. Can be used with the E-ED-6 Power

Cable or the Yaesu default NC-72B power cube supplied with the VX5.

7. SMA to BNC adapter.

8. ADMS-1E Programming Software with computer cable and special adapter

for VX1 and VX5 radios. This is the updated version of software (late April

1999).

Your offer should allow for packaging, shipping and insurance from zip code

22701 (Northern Virginia).

Reason for selling: I love the radio, but since purchase, it has

essentially sat on my desk unused. Just no time to enjoy it with my work

and other activities. Please respond directly to w3yb@erols.com .

.

The RS WX radio I had used a single crystal, and different trimmer capacitors were switched in and out while changing channels. I suggest you open the radio's case, look for one of the trimmers, and, with the channel selector selected for that trimmer, adjust it with a plastic tuning tool, until you hit that frequency.

Thanks for all the posting and emails I've received. Unfortunately, some of the postings were not very favorable in respect to this particular model (TM V7A).

So, I'd also like to hear from users of this radio--what do you think about it? And what about TM G707? Any other radios (made by, say, Icon or Yaesu) to recommend in this price range?

By the way, I'm a relatively new ham, certainly don't need all the advanced features and after using two handhelds for 2 years, I'd like to get a nice dual mobile!

Thanks,

Jack

I bought one at Dayton from HRO. They were selling it there at $229
although I think it's more expensive (~$325??) after Dayton. I'm
waiting for delivery of it and will post a review when I get it and
stick it on a TV antenna rotor on the roof.

Yeah. I found this really interesting. But what has all this got to do
with Soc Penpals? I don't really care anything about radio
communications of any sort. So why not just keep this on the boards that
apply and take it off soc.penpals. As far as I am concerned amateur
radio is atrocious, even worse than CB used to be here. I have never
heard of so much crap on any wavebands before. How these people get
operating licenses is beyond me.

I'd go with an outboard supply. In addition to the reasons the others listed, you can also get alot of extra heat in the radio which you really don't want from what I've heard. Also other supplies may have better features. Also if you ever decide to use portable on 12v you don't have that extra weight in the rig to lug around. MK

I have a Yaesu MD-1 Microphone left over from my 757 transceiver. It is the base mike with buttons for Down, Fast, Up, Lock and PTT.
I want to use it on my Icom equipment but I do not have the pin out configuration for the 8 pin plug. I know it is different from the Icom but I sold the manual with the 767. Does anyone have the pin out configuration for the MD-1.

Thanks

I sure hope you can get that much for a controller that is no longer supported and 2 of the parts are discontinued and costs over 800 to repair it when needed. I sure won't pay for it at that price.. maybe around $200.

There is a new QRP kit that just came on the market. The specs are excellent with a innovative design of no wires in the radio.

It is called the K2 160-10m SSB/CW transceiver.

I'm actually looking to find out who's done what to "improve" the unit... I've heard that there is a mod to increase the monitor level which seems low, the mic level is too low to use unless you buy ICOM or buy or build an external preamp, I'd like to be able to select the CW filters for use in the SSB function for PSK use, I'm sure there's a mod to allow transmission on all frequencies although I personally don't care about that one unless we get some new band allocations.

Source record: 107803
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.amateur.equipment,rec.radio.amateur.boat-anchors

Hi,

I just picked up a pair of Datong filters, an FL2 Multi-Mode
and an ATF Auto-Notch filter, but they didn't come with any
manuals or other info.

The ATF is pretty simple and the controls are fairly obvious,
but the FL2 is a bit more cryptic.

If anyone has, or can provide pointers to, manuals for either
or both of these, I'd be very appreciative.

Replies via email to KC4YYY@ARRL.NET would be appreciated, as
I only get to browse the newsgroups on the weekends...

Thanks,

Patrick

Bill, passed away a little over a year ago now.

As for the "pin diode mod". It does reduce the
overall background noise level, but as to if it is
cost effective is debateable. Also, pin diodes are
at greater risk to electrical storm damage. If
you live in a area prone to lightning storms, I
would not recommend it.

HI:

The pin diode mod was made famous by Bill R., who is a silent Key.

The mod does reduce the noise floor, but not that much, it is the other mods, promarily the PLL caps in ICOM that quiet down the PLL output that help as much or more.

Pin diodes also have one major draw back. They will not handle large energy surges as well as "the generic" diodes will. If you live in a lightning prone area, premature failure tends to result.

I tested the mod both on the air and with bench equipment, yes there is a noise reduction. The mod itself reduces the Rx noise by 2-3 Db, typical costs to do the mod is in the $100 area. If you use CW narrow, it may be worth it, otherwise it is debateable.

I have a broken Yaesu FT747 for sale.
The receiver works fine, on xmit it is very garbled and cuts out a lot.
Also the computer interace has failed, Yaesu 'CAT' interface, and it eats
lithium batteries so the memory doesn't work.
Good for parts if you have a working FT747.
Has the 500hz CW filter and the FM board.
Yaesu no longer makes the CPU for this unit.
$250.

Contact me via EMail at:
ki8ee@stratos.net
donn.sachs@uhhs.com

Thanks,
Donn.

*****

For Sale:

Brand new RCI Ranger Factory Service Manual for the RCI Ranger 2950/2970 series radios and the latest RCI Ranger Federation CDrom. The large service manual has all schematics, board views, voltage charts, alignment information, parts layout, parts identification and sources. Excellent clarity and written in English!

The CDrom is loaded with all kinds of modifications, tune up information, tips, tricks, etc to make the radio PLAY! The RCI Rom 1.1 is the first to deal with the CB Radio with over 350 Mb of pure technical information on the RCI2950, 2970, 2980, 2990, Saturn Turbo, Sommerkamp DX2000, Mirage 2950, Hercules and similar rigs . Included are tutorials, audio explanations, video tutorials, alignment chart and much much more. For additional details check out:

http://www.rciweb.com/

If you own one of these super radios, this is the package to make your Ranger stand out and keep it well maintained. $45 includes shipping CONUS.

Thanks,

73 Bill N4ALG

*****

Hygain Ham II/CD-45 rotator - includes late model ('94) CD-45
motor w/serial number 94077, Ham-II control box in
excellent condition, 65ft of 8-wire cable and bottom mast
mount assembly. The motor has been used outdoors for three
years turning a small 6m and 2m yagis. It looks very nice
+++ with little evidence of outdoor use. The mast clamps
and mounting hardware look like new. $165.00 plus shipping.

Thanks,

Bill N4ALG
bcotter@pop.uky.edu

Let's see, I can recall that there's RadioKit, Vectorkit, Hamtronics, and
probably lots more. Just pick up a TechAmerica catalog and look for
kits, then contact the maker and see their whole line, not just the few
that TechAmerica carries.

Or go to Radio Shack, and look for the catalogs in the stand. They have
LOTs of kit catalogs in there, all stuff you can 'special order' though
Radio Shack. A lot of kits. But some other neat stuff, like Channel
Plus for video...

4358. Need low-power field strength meter

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-19 00:00:00 UTC
From: tcwikla@escape.ca
Message-ID: <7hun81$cf1$1@pumpkin.pangea.ca>
Source record: 107817

I'm looking for a low-power field strength meter. I have a transmitter that operates in the 300 MHz band with a directional antenna, and I want to know if the output is less than the legal limit of 200 uV/m. Are there any meters that will measure this low? I've seen meters that measure signals as low as -110dBm but is that enough to measure 200 uV/m with a single-element antenna?
Should I buy a broad-spectrum field strength meter or a tunable one? If it has to be a tunable one, what bandwidth should it have? The ones that I've seen usually have very wide bandwidths, like 190 kHz or 450 kHz but I've seen one that has 7.5 kHz. What do the FCC labs use for their testing?

Source record: 107821

Comparing a 706 to anything HF Ten Tec makes is like comparing a kids' tricycle to a Harley with a sidecar. A 706 needs a DSP unit just to imitate an adequate receiver.

100 watts out doesn't mean much when you can't copy the station calling you.

SO Chuck .... are you saying that the new 6N2 from Ten Tec has DSP?
Or that it is better than the new Icom-706?
How would you know?
Have you got a new Ten Tec 6N2 and if so how did you get it?
The new Icom-706 has DSP and you can buy one now.
It also has the HF bands and a General Coverage receiver. The "new" Ten Tec 6N2 has none of that.
Some tricycle .. huh.
BTW .... Harleys are not all that great..... even with a side car. (ever own one of them?)
Better take off your blinders and look around some.

Yaesu FT-100 Specifications

General

Frequency Range Receive
100kHz-961 MHZ(Cellular blocked)
USA version
Transmit 160-6 Meters
2 Meters
70 Centimeters (Amateur bands Only)
5167.5 MHZ Alaska Emergency Frequency
(USA version only)
Emission Modes A1 (CW), A3 (AM), A3J (LSB/USB).
Fl (9600 bps Packet), F2(1200 bps Packet),
F3(FM)
Synthesizer Steps (Min.) 1.25 Hz (CW/SSB), 100 Hz (AM).
l00Hz(FM),1 kHz(FM)
Antenna Impedance 50Ω, Unbalanced
Operating Temp.Range -10°C to +60°C (14°F to 122°F)
Frequency Stability Better than ±4 ppm (-10°C to +50°C)
(SSB/CW/AM)
Better than ±(l kHz +4 ppm) (FM)
Power Requirements DC 13.8V ±10%, Negative Ground
Current Consumption Receive (Squelched) 1.2A.
Receive (Max. Audio) 1.6A
Transmit: 20A (@ 100W RF output)
Case Size 160(W) x 54(H) x 205(D) mm
(6.3" x 2.2" x 8.0") WHD
Weight 3kg.(6.6 lb.)

Transmitter

Power Output 180-6m 100 Watts (25 Watts AM carrier)
2m 50 Watts (12.5WattsAMcarrier)
70cm 20 Watts (5 Watts AM carrier)
Modulation Types SSB Balanced Modulator
FM Variable Reactance
AM Early Stage (Low Level)
FM Maximum Deviation ±5 kHz (±2.5 kHz on FM-N)
Spurious Radiation
Harmonics At least 40 dB down (1.8 - 29.7 MHZ)
At least 60 dB down (50/144/430 MHZ)
Non-harmonic At least 50 dB down (1.8 - 29.7 MHZ)
At least 60 dB down (50/144/430 MHZ)

Carrier Suppression At least 40dB
Opp. Sideband Suppression At least 50dB
SSB Frequency Response 400Hz-2600Hz(-6dB)
Microphone Impedance 200 -- 10 k (Supplied microphone 2 k.)

Receiver

Sensitivity SSB/CW AM-N FM
150 kHz- 250kHz (IPO off) 5 V 40 V -
250 kHz- 1.8 MHZ (IPO off) 4 V 32 V -
1.8 - 28 MHZ (IPO off) 0.25 2 V -
28-30 MHz 0.25 V 2 V 0.50 V
50-54 MHZ 0.20 V 2 V 0.50 V
141/430 MHZ 0.125 V 2 V 0.20 V
Above Specs are worst case.
SSB/CW/AM-N figures are for 10dB S/N, SINAD on FM

Squelch Sensitivity SSB/CW/AM FM
1.8-28 MHZ 2.5 V -
28-30 MHZ 2.5 V 0.32 V
50-54 MHZ 1.12 V 0.20 V
144/430MHZ .08 V 0.16 V
Intermediate Frequencies
1st IF 68.985 MHZ (SSB/CW/FM/Digital)
67.980 MHZ (W-FM)
2nd IF 11.705 MHZ (SSB/CW/FM/Digital)
10.700 MHZ (W-FM)
3rd IF 455 kHZ (FM)
Image Rejection Better than 70dB(1.8-30MHz,50-54MHZ)
Better than 60dB(144-148 MHZ, 430-450 MHZ)
IF Reject ion Better than 70dB(1.8-30MHZ)
Better than 60dB(50-54 MHZ, 144-148 MHZ. 430-450 MHZ)
Selectivity (-6/-60 dB)
SSB/CW 2.2 kHz/5.2 kHz
CW 450 Hz/1.8 kHz (Optional XF-117C installed)
CW-N 250 Hz/1.2 kHz (Optional XF-117CN installed)
AM 5.2 kHz/18 kHz (Optional XF-117A installed)
FM 15 kHz/25 kHz(-6/-50 dB)
Audio Output At least 1.5W into 8 @10% THD
AudioOutput Impedance 4-8

Specifications are subject to chance without notice, and are guaranteed within amateur bands

4368. Metron Amp ?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-19 00:00:00 UTC
From: Philip de Cadenet <BigMobile@g4zow.freeserve.co.uk>
Message-ID: <99retCB60uQ3EwBI@g4zow.freeserve.co.uk>
Source record: 107827

Two questions regarding my Metron.

1. Does anyone have a spare copy of the original manual with circuit for sale?

2. It seems not to like operating on 160m. This is probably down to the filter value. It seems to draw excess amounts of current below 2MHz as compared to above 2MHz.
If someone can suggest the correct capacitance value in the chebychev filter to get this thing to operate properly on top band I'd very much appreciate it.

Thank you in anticipation.

I recently found two of these nice amp's brand new in their boxes but unfortunately without any manuals.

Tnx for the info. I (partially) solved the problem by lowering the FM deviation (R61 for VHF, R289 for UHF), but that would be better.

> Hope this helps, but you are making me nervous about you comments. I do
> need the extra features, but actually head that the intermod immunity was
> excellent with this radio, but perhaps not?

I don't think it's far better (or worse) than on other TRX with same capabilities (i.e. kenwood TM 733, etc). You can't expect miracles from general coverage receivers (~118-950 MHz) with NO serious filtering.

I've been using an IC-2710 for more than 2 years now, I think performance is quite good for normal usage. Anyway, if you're located just near a broadcast station or a professional transmitter, chances are that you'll hear what shouldn't be heard :-) And the 10 dB attenuator won't help so much in this case. But don't panic, this happens also, for example, with TM-733, and probably with others.

If you really need a receiver that can be used in environments with strong signals, then have a look at serious mono-banders like IC-2000 or Yaesu FT-2500 for example.

> Anyway, thanks for the comments

Some short comments to finish :
- no text name for the memories
- it's not possible to activate AM receive on all bands
(only on 118 and 220 MHz but not on 134 or 470 for ex.)
- no packet jack (& strange behavior of the PTT line :-)
(Anyway mine is now 9k6-ready, if someone is interested, let me know)

These are the few drawbacks I found. The rest is globally positive, and this TRX is really a pleasure to use. The separate commands for each receiver are very nice, compared to other TRX. The receiver sensitivity is very good on ham bands, even on V/V or U/U receive.

Hope this helps...

Excellent Collins plug-in mechanical filter (F455 FA 08 - 800hz CW) along with four new JAN accessory crystals - 18.0, 28.0, 28.3, and 29.0 for $225.

I also have two excellent 75S3b manuals, one is the Nov 1975 Rockwell edition (brand new) and the other is a June 1964 original edition manual. Make offer.

Thanks,
Don Rasmussen WB8YQJ/6
Carlsbad, Ca.

4381. Re: Lithium Ion Batteries

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-19 00:00:00 UTC
From: dawson@sopris.net
Message-ID: <37443d06.186442275@news.sopris.net>
Source record: 107840

Here is my approach to using Lithium with the 50R, but I don't know if it works that great yet. Perhaps someone here can help me:

I have the 4 AA battery pack. I got the Energizer 1.5 v lithium cells. They work fine, but the pack only has 6 volts, and thus I can not TX at full output.

Proposed solution: I purchased some 3.5 volt lithium cells. Placing 4 of these in the AA pack gives me 14 volts. But I'm afraid to try it, because the regular battery packs only have 9.6 volts. I looked at the 50R circuit diagram, and it looks like all battery current goes to a 3v regulator, so I'm guessing that I can feed 14 volts to the 50R from a battery pack. On the other hand, I see there is a little something on the diagram called a "reg sw," which is the first thing the current encounters when using an external car adapter or other 13+- volt source going in to the "ext dc" jack.

Anyone here know if one could feed the 50R 14 volts from a battery pack?

BTW, the specs for the radio say it can take up to 16 volts, but does that mean from either the "ext dc" jack or the battery?

Thanks for any help with this!!!

From: Martin Spencer <martin@SPAMOFFb-right-on.demon.co.uk>
Message-ID: <37433BA0.4BABF937@SPAMOFFb-right-on.demon.co.uk>
Source record: 107843

Hi,

Has anyone on here used the HC Protek 3201? - half way between a scanner and a spectrum analyser, and almost hand held. It goes from 100kHz to over 2GHz.

I was particularly wondering about dynamic range, susceptibility to spurious responses and intermodulation. Also noise figure.

Does it first upconvert to >2GHz like a real analyser?

Thanks in advance if anyone can say,

Cheers,

Martin.

Hardly used 'President' Uniden 2510. No mods ever done. It has just sat on my desk with the idea of someday using it as the basis of a VHF/UHF transverter. Check out FB into a Dummy Load this past weekend. (tried to make a QSO, but either the band or all the ops were dead). Comes with mobile mounting bracket, microphone and a photocopy of the technical manual. What am I offered at or above $175. Rather not go the Ebay route.

Reply to AE2J@arrl.net..

Bob-

I'm fairly sure I have that one. It does not have the built-in counter, but has a place you might plug a counter into. You can't trust the frequency dial, but it works well if you can listen for it on a calibrated receiver.

The only problem might be if there is a transmitter nearby that can cause interference with it. For example, the local club tried to use one at Field Day one year, but got ridiculous readings. It turned out they were only 1/2 mile away from a tower that had an FM broadcast station, as well as two high powered paging transmitters.

> with Soc Penpals? I don't really care anything about radio
> communications of any sort. So why not just keep this on the boards that
> apply and take it off soc.penpals.

Let me try to explain. When people reply to a post on a newsgroup, they don't usually read what newsgroups are all listed and delete the ones they THINK are not appropriate. They just hit send, and it goes to all the newsgroups the original post was on. Blaming the person who replied to the post is silly, he did not choose the newsgroups listed.

And to delete any of the groups would be just as silly, because you are sending a reply to the post and don't know which of the groups he will be checking back to read your reply, so it makes sense to leave everything as is.

Why do people hate logic and common sense so much?

4399. For Sale: Kenwood DSP-100 (rare!)

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-19 00:00:00 UTC
From: Steve <steve.w3sy@erols.com>
Message-ID: <7hvu34$33n$1@autumn.news.rcn.net>
Source record: 107858
Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

For Sale: Kenwood DSP-100 in excellent, like-new condition. Cables, manual included. Plugs directly into your TS-450, TS-850, etc. Gives you ability to vary the sound of your SSB signal from "broadcast quality" to a sharp, narrow signal for contests and pileups.

Also adds carrier suppression and unwanted-sideband suppression.

Can set CW rise and decay (fast vs. slow).

Sell for $400 and will split shipping cost anywhere in continental USA.

73,
Steve W3SY

I have a pair of DJ-S11 radios that I REALLY like.. They work great for mobile to mobile on the hi-way. and for working on the tower or the like. I have done HT to base over apx 3 miles in the city. I also like the 80 mw setting. I bought the first one at full price and was at HRO again in about 2 weeks and they sold me a demo unit for half price. I would not ever give them up.

With Yahoo! and amazon.com and presumably many others jumping on the auction bandwagon, I wonder if we will be seeing an variation in the rules for on-line auctions? What I mean is, it has always seemed to me that the bidding procedure on eBay was ludicrously unfair to buyers.

In any of the other auctions I have bid in before, one of two methods applied: Either you show up in person, at a certain time on a certain day, and bid on a lot directly, having no more than a few minutes to size up your "competition" and how high you want to go, or, you submit a sealed bid, only once, and wait . With the eBay way of conducting auctions, little can be done to keep shill-bidders away, and the closing price gets bid up in a childish bidding feud based less on the value of the item up than the egos of the bidders, wanting to "win." You will see an item on eBay with 30 bids, but only 6 bidders. People are bidding multiple times, often at the last minute. This flies in the face of fair play and sportsmanship, as the winner is often the bidder who is willing to sit rigid in front of his monitor, counter-bidding until the last moment, unless eBay gets clogged with traffic, in which case, your out of luck.

Just wondering if some net entrepreneur out there will offer an ethical, traditional auction house anytime soon.

Frank,

You might check their web site, http://www.tentec.com. They are promising a new 2 *and* 6 meter all-mode IF-DSP transceiver sometime this year, don't know much else about it (i.e. features, availability date). The page says they expect a retail price of about $800.

Hi,

I happened across 4 excellent condition walkie talkies at a local garage sale. The radios are xtalled for 446 Mhz FM. I'd like to know if this part of legal ham band(USA or Europe) or one of those commercial bands that do not require a license to operate in. The original owner was a retired travel agent that used those while guiding a tour group through Greece.

The radios were labelled "Eagle 1" at the top and there are labels in the back indicating that it complies with FCC requirements. The radios were made in Japan. With the exception of top plate and knobs, the radio case is entirely anodized Al metal and very well built. Has anyone any experiences with these radios?

The part that bugs me is that they discontinued a much superior product in the '202 for this piece of QRP junk that really looks like too much trouble to deal with. For 1W of output, if you're really that much into QRP, the '202 had a switch right there on the top that allowed you to drop your power. Also if you ran with less than 12v supply you were usually somewhat below 1w. I think we were able to get 750-850mw with a 9.6v supply. Just another example of how the "Shack" has lost sight of the values that they were based on.

Just my opinion,
Joe Denison

I've got a DJ-C1, and I'm pretty pleased with it. I can hit the repeaters that are up to 25 miles away if I have a clear line of sight. The closer repeaters are almost always reachable, but I do break up a bit as I walk behind into a "shadow" behind a building. (They're about 5 to 10 miles away and up on hills.)

I've tried it from my car and it works, but the signal is definitely weaker; there's usually a fair bit of white noise.

Other plusses: it's so small, I take it literally everywhere. On the downside, the lack of a built-in speaker is kind of strange (but I'm getting used to looking like a secret-service agent with an ear-plug speaker), and sometimes I wish it had a "standard" antenna connector so I could put on a bigger antenna or hook it to an amp.

This isn't a "busy" place for RF, so I can't say much about intermod, etc.

I have again put on auction on ebay a receiver seldom seen: a "very
scarce" (as
Fred Osterman puts it)Hammarlund HQ-215. This 80-10 Ham band only
receiver can
be "expanded" by plugging in crystal in 13 available sockets.
At the moment, with the unit, several optional crystals are furnished to
cover the WARC bands.
I had to relist because the highest bidder, w0ogm, paid with a "rubber"
check. Here's the link:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=106860971
Thank you very much for the bandwidth!

4426. new all band rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-20 00:00:00 UTC
From: matteone@my-dejanews.com
Message-ID: <7i1q8o$fk7$1@nnrp1.deja.com>
Source record: 107685

I am about to buy a new rig and i am quite in terested in multiband rigs (HF, 6m, 2m, 70cm) since they're able to give all in one - and this can turn useful especially in satellite connecting and so on.

I have heard though that those new models, like Yaesu base rig FT847 and Icom IC706MKIIG, have not the same capabilities of the classic old separate rigs, that is one for the HF and one for the VHF/UHF. I think the idea started basically from the fact that two radios in one HAS to be worse that the two separate radios. Obviously I think this depends on how many circuits are shared between the different bands and in which way they are; this means that only a test on the field can give a meaningful response to this question: one all band rig or two rigs for the different bands?

i would like to know if any of the participants to this newsgroup had the occasion to work with one of those new rigs, in order to get some suggestions or impression from first hand users

thank you
Matteo Campanella

Well, I managed to break my Santec ST-440uP. A tip for idiots like me, don't remove the battery connector from the PCB... Anyways, I pulled off the spare battery charger plug out of the charging unit and put it into the radio and it seems to work OK now. But here comes the problem... I don't have a battery! OK, I saved the other side of the connector from the old battery pack(which was leaking), and I can get the thing to kinda work from one of those $10 battery eliminators(I don't recommend it... I'm pondering adding some sort of filter to it, and they aren't regulated), but that doesn't work very well for an HT. Does anyone know where I can get a battery for this thing, or should I build one? I figure I might be able to get an RC car pack from RatShack to work if I put the old connector on it, but it's kinda corroded from the leaking NiCads. So here comes the second question, what is and where do I find that connector?

I have the same unit acquired at about the same time (1985). It is an excellent amplifier but you may wish to fire it up on 115v initially since the caps are in all likelihood about ready for replacement. Run it briefly and if nothing blows, shift it to 220v. You might get lucky. Henry sells a kit which contains all the caps for somewhere around $100 +/-. Simple to replace should you need to do so. I replaced mine in 1996. I don't know of any mods that are worth implementing.

Sounds as if you got a deal with the house and station, all ready to go.

Good luck,

Bill

I noticed this same thing!

The large batter does not allow a clip.. There is a special case, made by another company, which fits the FT-50 on the belt with that large battery. I use my radio daily, and would prefer to use the hi capactity, because the the limited use with the small one supplied with the unit. I am special ordering, and waiting for that case's arrival. I can let you know how and where to get one, and how it performs when I get it, if you like.

Other than that. I love the radio, it's small, rugged, and has all the features I need.

Sounds as though they repeated the programming error of the HTX-202
and added the underpowered error of the little Alinco ... wonder who
built the thing for them? Sad. They could have themselves a huge market
for an aggressively priced small basic HT. Perhaps they just hacked a
FRS HT to run on 2m? K1YP

The DS-1 is required. It is two transistors on a heatsink which completes the high voltage inverter. You can run the receiver with 12 volts wihout the DS-1 however. The TS-820 and 520 used the same DS-1.

Pierre,
Check out the Standard C510A from TechAmerica (they have a web page), the thing goes for about $199.00 when its on sale. This is a Killer HT with fantastic features. Standard is all screwed up and has not marketed the thing at all ,---but I have one and have recommended them to lots of other Hams with always the same comment.---What a great Radio!
No I don't work for Standard---Good luck

I'm selling my Pro2005 base scanner with manual and service manual and receives cell phones and has 6,400 memories and also has a short wave mod where you can hear short wave through the scanner. Great condition and comes with a external speaker and base telescope antenna and a radio shack 20-014 base house antenna with about 50 feet of RG6 coax cable. I will sell all for $450.00 dollars not including shipping.Will not sell any thing separate. Sell only as a package.
Thanks

If you are using a Garmin GPSIII for your APRS and not knowing that you are eligible to upgrade to a GPSIII Plus, the deadline to place your upgrade order is May 31. Garmin must receive your GPSIII by June 15 for processing. Cost is $100 and is only applicable for North America version. Don't forget to order your MapSource CD for street level display! Garmin's technical support number is : 1-800-800-1020. Make sure you get the instruction on how to ship back the old GPSIII. Turn around time is about 1 to 2 weeks. Good Luck!

Sorry if this message is in the wrong group. I just think that this is a good deal and want everybody to know about it.

Best 73!

on-line
> auctions? What I mean is, it has always seemed to me that the bidding
> procedure on eBay was ludicrously unfair to buyers.

How so? If you don't want it, don't bid on it. If you don't want to spend -that- much money, stop bidding earlier. If, however, you are complaining that eBay is unfair to buyers who want the product at a lower price, then just go somewhere else.

> In any of the other auctions I have bid in before, one of two methods
applied:
> Either you show up in person, at a certain time on a certain day, and bid
on a
> lot directly, having no more than a few minutes to size up your
"competition"
> and how high you want to go, or, you submit a sealed bid, only once, and
wait.

Yes, but on the internet, things are done differently.

> With the eBay way of conducting auctions, little can be done to keep
> shill-bidders away, and the closing price gets bid up in a childish
bidding
> feud based less on the value of the item up than the egos of the bidders,
> wanting to "win."

So what? Internet auctions are a 50/50 split between buying things and entertainment. If somebody defines a good time as spending more than what you think is a fair price for something, then buy things somewhere else.

> You will see an item on eBay with 30 bids, but only 6 bidders.

So? This happens in real-world auctions as well. Sometimes you'll even see hot and heavy bidding wars in which 2 or 3 people will submit several dozen bids in just a few minutes. You've never been to an estate auction with lots of antiques, have you?

> People are bidding multiple times, often at the last minute. This
> flies in the face of fair play and sportsmanship, as the winner is often
the
> bidder who is willing to sit rigid in front of his monitor,
counter-bidding

> until the last moment, unless eBay gets clogged with traffic, in which
case,
> your out of luck.

a) Why does it fly in the face of fair play and sportsmanship, and b) why would it matter if it did? The action exists primarily for the seller to make as much money as possible. Neither the system nor the seller care if the losers feel put out by the process: you want it, then bid enough for it. If you don't want it that much, then go buy one off the shelf. In free market capitalism, profit - not sportsmanship - is the driving force. Either you are willing to expend the resources (money, time, rigid sitting before the CRT) or you don't get the item in question. Doesn't get any simpler than that.

> Just wondering if some net entrepreneur out there will offer an ethical,
> traditional auction house anytime soon.

Why don't you do it? Or scrape up a few million in venture capital and I'll do it.

Personally, I avoid eBay. Never visited the site, never will: the president of eBay is buddy buddy with Al Gore and has reportedly been giving generous donations to his election campaign: supporting and/or using eBay is practically the same thing as voting for him.

From: dawson@sopris.net
Message-ID: <3745b418.18426393@news.sopris.net>
Source record: 107731

Update: A radio technician told me to go ahead and use 14 volts if I wanted, but that it would reduce battery life and give me more tx power than I really needed. So, I used 3 of the 3.5v lithiums and a dummy AA cell. Voltage is 10.5 with no load, and the radio appears to function beautifully. Sweet.

One bad thing. Many seem to blow Q19? and usually when replaced, they don't do it again but some have 2 or 3 replaced. 3 of the 10 owners I know had this problem. Units being sold now don't seem to do this anymore. Mine hasn't in 6 months of owning it. I turned down the high power to 45 watts, maybe that helped. It does have more features than any 2 meter rig I've ever owned. Intermod protection is very good and if you should have some problem with this, just use the squelch/attenuator and your rid of it. Easy to read dial. Somewhat slow scan rate is 8 channels per sec. Not up to Yaesu's 26 per sec but better than Kenwoods 4 per sec. Icom continues to have the best tx audio. The FT2500 is its only real competition and it has many more features so it comes out as the best so far as I am concerned. I have no report on the new FT2600.

Source record: 107741

Greetings,
I have 2 of these radios for about a year now and I have no problems with either. I like the alpha-numeric display and the fact it has 55 watts output instead of the 50 that my V-7 has (not that 5 watts makes that much difference).
It is a good radio at a good price and has the most features of any radio in that catagory.

Will,
> This
>flies in the face of fair play and sportsmanship, as the winner is often the
>bidder who is willing to sit rigid in front of his monitor, counter-bidding
>until the last moment, unless eBay gets clogged with traffic, in which case,
>your out of luck.
I share your feelings.

I have no suggestions other than the fact that there was an item I
wanted several weeks back. The auction seller was in Texas, I'm 7hrs
ahead here in the UK. The auction ended at around 3.12AM!
Now I wanted that AM broadcast exciter, so damn well had the alarm clock
set for 2.30 so I could watch the bidding.

Talk about getting the adrenaline going, but I won out in the end. I was
so afraid of losing I must admit to throwing in a third bid of multiple
bid increments just hoping to stay one furlong ahead of the pack.

I succeeded.

What is one to do? Some would say it's all part of the fun. Others have
said the market will find the highest price. I don't think ego has
anything to do with it unless you think people have more money than
sense in which case, that's their problem.

300 bucks.

I am the first to agree that many lack common sense these days, but what
happened to all those complaints we used to get from newsgroups that
your posting was 'inappropriate' to the newsgroup in question!
Let's suppose we broadcast this thread in say uk.misc or talk.bizarre,
or maybe even soc.culture.israel then they would soon let us know about
it!

Do not beleive all that you read. All radio manufactures make some poor radios that are not tuned correctly at the factory and then you get a few vocal people (on the air and on these NG) that label the entire line (model) of radio as bad.

I have a V7A and have had no problems. The transmit audio if fine. The intermod problem is ok and is in par with all the other vhf/uhf radios that are available to hams.

The biggest grip you hear about this radio is the blue screen. In bright sunlight it can be harder to read. I have fixed this problem by putting the display in reverse display mode and turning up the contrast via the menu system. With the display tuned in this way it is as good as any of the smaller amber displays.

I like the V7A and have had no problems with the radio.

4480. Running Kenwood TS-520S on 12VDC - what's really needed?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-20 00:00:00 UTC
From: ken.hoover@DIE.SPAM.DIE.yale.edu
Message-ID: <37441b80.176132828@news.yale.edu>
Source record: 107750

Greetings-

I have a Kenwood TS-520S that I want to convert to run on 12V
battery power. I see that "12VDC power" cables with the special plug
for this rig turn up from time to time but I also hear of -- but never
have found -- the 12VDC "converter" (model DS-1A?) that this unit
needs to "run" on 12VDC.

Thus my confusion: Can I use the DC power directly from a battery
via the special power cable or do I need to use the special cable in
tandem with the DS-1A?

What does the DS-1A do anyway? Is it just a 120VAC -> 12VDC power
supply or does it invert 12VDC back into 120VAC and then feed the AC
into the transceiver via the special plug?

Please email responses if possible. I'm asking rather than
experimenting for obvious reasons!

Thanks in advance for any help you can give!

I have two Intermarine HF amps to trade or sell. Both have three 8874's, very low hours, 4' cabinets. They are auto tuned with loads of relays and series/parallel switched caps in the tank. Tanks need repair, tubes and supplies are good. Looking for a decent desktop amp in good working order. Designed for 1500 watts RTTY shipboard use.
Chicago area / suburbs only.

Also have a set of International Radio Co. SSB filters for TS-940.

Reasonable offers considered..

Please excuse the repost, I heard that some people where having trouble sending to my work address so I am now using my Ham address. Tnx, Dave

For Sale Kenwood TS 850 sat HF radio, covers 100khz to 30mhz. Comes complete with an internal antenna tuner and keyer. I have added additional filter for CW and SSB (500hz and 2.6khz). Just over 2 years old and in great shape. On a scale of 1 to 10
for appearence this would be a 10. I have worked all over the world with this radio and a wire antenna. This radio is able to pull signals out of the mud and received glowing reviews from QST mag.

Price $1100.00 with filters.

I have been to many many hundreds of auctions , and have NEVER not seen
house shills... it is a part of the Auction way of life... Yes I do buy
and sell on E-Bay, but would never stoop to having a shill bidder or a
different account to bid on my own items... I try to make a living doing
this, and drive between 600 to 2,000 miles a month looking for items to
sell and for my own Amateur interests... Some people seem to think that
a snipe bidder is watching their every move, and this is not the case...
IF YOUR HIGH BID IS EXCEEDED BY A PRIOR BID, then you will get the "you
have been OUTBID by another bidder" message until you exceed that
persons bid... this is not snipe bidding... if you read the procedures
on bidding, you will find them to be as fair as possible for an "e" type
of auction... I have looked at Yahoo auctions and some others, and have
e-mailed sellers about their items , and NOT ONE EVEN RESPONDED!!!! and
one of them was in my own city...

You can consider your bid on E-Bay a "Sealed" bid, as it is hidden until
the end of the auction. I try to put fair reserves on my items , and

this I would think would be an easier way to tell who might have "Shills" bidding for them... if you have no reserve, and you have seen some bids, but the price is still quite low, then a FEW people may decide to have the bid increased by a shill...

If you go to auctions regularly, you will develope your own method of bidding, and mine is to wait until nearly the end of the auction and see if the item is worth that amount or more to me. If it is I will wait as long as possible to bid. Why bid against yourself? That is what you do if you bid several times... Have you ever been to an auction and seen someone bid on many items, and never win??? Well that is the first sign of a shill... and every public auction I have been to has "house" shills, and so do many of the "Regular" sellers at these public auctions... this is an unfortunate part of auctions. If you don't wish to pay the amount , then don't bid.

So as far as an "Ethical" house auction goes, there isn't one. That is what always happens when money is involved... just my .02$ worth... 73 de Jordan...

I've got one of that during Dayton Hamvention for $229. I first spotted it on top of the ICOM fun mobile and didn't have a clue of what monster that was except that it looked small and cool. Too bad, I can't even recall the model number now!

The weight, including box and everything, is only 30lbs and I am planning on putting it up sometime this summer. The Mosley Mini-33 was the one I set out for, but ended up bring home with this antenna.

Jeff from Cushcraft was extrememem curtious and friendly, helpful, too!

Just a couple thing to be mentioned: The box of this antenna says 5 Elements beam. This shocked some of the people on the shuttle bus when I hauled it back to the Salem Mall parking lot. I was shocked too when I saw that I paid $229 for a 5 element yagi! 5 bands should have been more appropriate. A bug to report as the first generation product?

Also, without the catalog in front of me, the antenna is actually a 2 element beam on several bands and 1 element (as a rotatable dipole) on the other couple bands. It looks like a 3 element beam, but doesn't work like 3 elements, electrically speaking.

Harrison Labs was a Hewlett Packard owned company that stopped operating in the early seventies as I remember. They (HP) also had a company called Dymec that made power supplies. The Dymec symbol was the HP logo turnned upside down. Lower case letters were used for both symbols. Dymec was a mid sixties company.

It is unlikely that the unit would be easily convertable to 50 volt operation. It is most likely a linear supply with a pre-regulator or a tracking Variac on the input. It will also not use silicon transistors. It will be very heavy and either single phase 220 volt or possibly 3 phase 208.

It's not an opinion it's the truth. and if you don't like it don't read it. I don't care for the controller due to the fact it is no longer supported and it's old and outdated. There are many controllers out there that can do the same things that the 850 can do. but if people want to pay the price to have alot of featuers in there controllers and not even use it to it's full advantage then I guess some nut will buy it. Also to AL This TECHIE as you call him has been into radio Since 1983 and even before that.. I am not a NEW TECHIE.. I tokk all the required NOVICE and TECH tests and do have a GRT license.. I just don't care to pay that much for a controller that has nothing to offer except a voice which I can add my self..

Yes. The DJ-C5 will receive 118-173.995, 420-473.9875, and
380.000-419.9875MHz.

> ...car-to-car and short range simplex communications...

I own the 440-only and the dual-band units. Although the DJ-c% does have
its internal speaker, you will want a earpiece while using it mobile.
The 440 unit, of course, requires an earpiece at all times.

300mW is plenty for your travelling caravans. You will appreciate the
battery life from the Alinco's lithium-ion cell.

However, if yours is an extended trip, you will not find a 12VDC adapter
for these units.

> How well do they perform in high RF areas
> (intermods)such as airports/airshows etc...?

I have enjoyed mine listening to local air traffic. I also used mine
while working the Califirnia 500 NASCAR race earlier this year. About
100,000 folks - MANY with FRS radios. For comms out there, we used 19
UHF repeaters, 475 HTs, et al. The DJ-C5 performed quite well for my
monitoring needs.

> I have some summer family outings coming up in the summer and I am
> wondeering if these radios are good enough for only 1/3 w power
> outputs.

Aare all famly members amateur radio operators? If not, consider FRS
(Family Radio Service) HTs. My two favorites are the Vertex VFX-10 (all
14 channels...DCS...Weather Channel reception...elegant in their
simplicity: an ON/OFF Switch / Volume control, and a channel selector.
Full 500mW output) and the Kenwood (a two-year jump on others...no
bugs...LCD display...audio inversion voice scrambling...CTCSS codes).
Each unit is available for $100. or less each.

> Is there any place on the net I can find some reviews of these radios?

QST Magazine previewed them...if you're an ARRL member, go to their site
at:

Patrick - this is a classic "messing up the HT" scenario. Please call Yaesu directly and see if they have any hints. You have already attempted a master reset per the owner's manual...

Best of luck. Please let us know what Yaesu says. And if it needs to go for repair, please let us know the cost, and the turnaround time.

> The new Icom-706 has DSP and you can buy one now.

And your point is...instant gratification? I'm not about to be drawn into the apples and oranges comparison you're insisting on making, sorry. The 706 fairly compares to neither new Ten Tec rig. I've read the specs on both these rigs, knowing Ten Tec has a track record of actually delivering what they measure, not promise.

> It also has the HF bands and a General Coverage receiver. The "new" Ten Tec

> Better take off your blinders and look around some.

No blinders on, just severely not impressed with the 706 in any of its 3 incarnations so far.

So which newly announced Ten Tec are you talking about, the 6N2 or the Pegasus? The 6N2 is a VHF rig. Period. Think of an FT-736 with VHF and DSP, but without the IF overload problems, not a 706. The Pegasus is a computer comtrolled HF rig. Think of a Kachina at 1/2 the price, not a 706.

I reiterate: the 706 has a really crappy receiver, and if you can't hear 'em, you can't work 'em. It requires DSP to even imitate a good, low noise floor HF receiver, like any Ten Tec, Watkins-Johnson, Marconi, Rohde & Schwarz, etc. Old Collins receivers or a Drake R4 put to shame a 706. So does the new Elecraft K2 kit (I'm a field tester) for 2/3 the price. Even a Ten Tec Scout is a better comparison. Better HF, no VHF, one S unit output difference. No DSP needed, no $100+ optional filters to buy.

How long have you been doing RF engineering? I spent 18 years doing so for a living. Better take off your Icom blinders and look around some.

That is incorrect - unless you mean by using your other hand's thumb. I
meant that all those controls may be hit with the left hand.

Some VX-5R controls are on the top-right...

4502. FS: Excellent Kenwood TS-440SAT -- Loaded!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-20 00:00:00 UTC
From: Jan N0JR <swanman@cfu.net>
Message-ID: <37443BDE.A99074F1@cfu.net>
Source record: 107772
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

This is my own one-owner/non-smoker stand-by transceiver. It is in top condition electronically and cosmetically, and was thoroughly checked and aligned by Kenwood-authorized service in 1997 and has been used very little since. In addition to the standard accessories - Kenwood hand mic, manual, and power supply cable - it has installed:

IC-10 Computer Control Kit
YK-88SN 1.8 khz narrow SSB filter
YK-88C 500 hz narrow CW filter
International Radio "Voice Squeezer" True RF Speech Processor (not the junk audio ompressor that was stock, which it replaces; switches on and off with front-panel "Proc" button; includes doc)
International Radio "Moni-Module" SSB Audio Monitor (for proper setting of the Speech Processor; switches on and off with front panel "Voice" button; includes doc)

The TS-440SAT is a full-featured radio, with 100+ watts out, 3-speed variable AGC, notch filter and IF shift, semi-break-in (VOX) and full QSK. There are split VFO's with TF-Set control to allow you to check where the DX is listening before transmitting, RIT and XIT, many memories, program and memory scan, and both front-panel keyboard and
VFO frequency entry. The radio is AFSK-ready and computer controllable. I will thoroughly pack, with much bubble wrap and 5" or more of styrofoam, and fully insure.

PRICE: $595 shipped CONUS. Tks es 73! jan N0JR

I don't understand Radio Shack's strategy at all on this one...nor on
their poor attempts at trying to produce a decent FRS radio.

This new Amateur HT can be easily "beat" by several other
more-sophisticated HTs out there. It surely is not an appropriate
"descendant" of the incredible-performing HTX-202.

I believe that EBAYS' type of auctioning is very fair. However the bidder must do some homework and decide what they are willing to spend for the item, place their maximum bid, then "walk away". The market will determine the "fair price." If you win... great, if you don't...Oh well. But if you think that on EBAY you can grab an item at the last second for a steal like maybe in a public auction...your sadly mistaken. It's not a scam, you have potentially millions of bidders on an item overseeing the "fair price." Personally I think the idea of EBAY and their software that runs the whole shenanigans', a tiny piece of genius. Phil W2GE

And just what do you suppose keeps away shill-bidders in the ordinary (not sealed bid) auctions you described above? The only thing discouraging shill-bidders is the fact that they might just happen to get stuck with the merchandise and the auction house still gets their cut of the price.

> and the closing price gets bid up in a childish bidding feud based
> less on the value of the item up than the egos of the bidders,
> wanting to "win." You will see an item on eBay with 30 bids, but

Is this any different from a real auction? This is the whole idea of an auction -- and real life auctioneers count on getting 'bidding fever' going.

> This flies in the face of fair play and sportsmanship, as the winner
> is often the bidder who is willing to sit rigid in front of his
> monitor, counter-bidding until the last moment, unless eBay gets
> clogged with traffic, in which case, your out of luck.

Other than the occasional possibility of delays on the internet, exactly how is this any different from a real auction?

4509. WTB: Diplexer

Hi,

I am wondering if any of these radios are modifiable for AM aircraft receive on either general aviation or military aviation bands,and how they perform for car-to-car and short range simplex communications. How well do they perform in high RF areas (intermods)such as airports/airshows etc...?

I have some summer family outings coming up in the summer and I am wondeering if these radios are good enough for only 1/3 w power outputs.

Is there any place on the net I can find some reviews of these radios?

:>I would be most appreciative. Thanks in advance.
:>Frank WQ1O

:Its not just a case of wiring pin for pin. A friend has the radio and
:tried to wire a mobile mic up and it failed. The Yaesu mic has some
:electronics in it for all the buttons in the mic.

I have the very same problem with an FT-3000. I want to wire up a
hands free system for my car.

:Be interested to hear if someone has managed this though!

I'd like to hear from someone who has done it with an FT-3000.

:73 Simon GM4PLM

> Why do people hate logic and common sense so much?

That is a silly question since the answer itself is common sense. If people were logical then who would have babies? Betamax video recorders would still be in use in Europe and Jesus may not have been nailed to a tree! If there is a God then perhaps she is sitting up there having a damn good laugh at us all - I am.

Hi,

Does anyone, I mean anyone (even some authorised
Motorola dealer) know anything about Motorola
MX3000 radio??
Our company has some (bought few years ago, and
I started to work here about a year ago) but
nobody knows where from, or where are all those
cables and software.
We also have some P210 and GP300 with programmers,
cables and software, but I need to program those
MX3000 - because they are useless on that old
frequency.

Please contact me by e-mail.

Sounds like they'd do better by becoming a distributor for the Icom Q7A
.. which typically sells for around $200.

Strange: RS is usually smarter in finding "new" products (e.g., most of
their SWBC receivers are Sangeans).

Agree re "apples and oranges". I have a 706MkII. Whatever its faults, it works fine for what I bought it for: Mobile HF SSB. The detachable front panel was a must for me, and the FT-100 was not on the market. So I sold my FT-50 (good radio, but not compatable with the car I have) and bought the 706MkII. The 706MkII has served me well for mobile use on HF SSB.

Not likely I will be using any PC-based rig while mobile, however well designed.

I am eyeing the K2, however: Definitely would be a step up from the Sierra I built in 1996. But, I wonder how many toroids and tranformers must be wound (since the 42 in my Sierra for 5 bands almost drove me bananas!)?

Source record: 107598

I'm Roberto IK2RND , I have realized a replacement board for EX-314 MEMORY BOARD installed in these Icom rigs :
IC-745 IC-751 IC-751/A ICR-71A/E IC-271 IC-471 IC-1271.
My board called EPROM/RAMBOARD definitely solve the problem related to the lithium battery fails. When battery fails the rig stop to work and you need to send your radio or EX-314 board to the Icom service center to replace battery and reprogram the board.
Data in the my board are stored in an EPROM chip the RAM is used only to store the 32 memory channels.
I will take 60 US $ including shipping air mail.

Source record: 107599

Here's my take on all the negative comments on their new low power $180 radio.
1) Like most of their items it will be on sale for $129 or whatever real soon.
2) With almost 8,000 stores & dealers all they have to do is sell 1 or 2 per store (less than the amount that are sold by non-ham commission hungry employees to "hunters" & construction workers ect.) and they will be able to call it the "BEST selling ham radio in the USA" as they did with the 202, they already know this.
3) There will be the "radio shack fanatics" that will come up w/ reasons why it's such a "great" radio as they did w/ the 202. I can hear it now, "Gee it was on sale for less and great as a second radio, and didn't really cost much more than ordering one of those $99 things thru the mail and it has feature "X" that the other didnt have and it must be built great because the sold me an extended warranty and....."""
4) As with their non-japanse Korean made Maxon built 202 the new one has to be made by Maxon or a similar company that makes little or no ham gear as Radio Shack has admitted many times the major ham mfgrs will not make anything for them (All "Icom built gear must be sold in the USA thru ICOM america, All Yaesu built gear must be sold thru "Yaesu Usa ect...)
5) Even though the 202 seems to have been a better radio than this one, Radio Shacks PRIMARY motive has always been $$$. They know they will sell a ton of these at $180, a ton mor at around $140, and eventually get the thing down to $99 and by the looks of the radio still make plenty at that price, and make other ham makers jelous of the sales numbers with their 8000 store on every corner selling power.
Don't kid yourself, no mystery here, just like their VCR's and clock radios, it's never hard to find a better product at a better price, but they will always sell loads of what they carry.

You can make a battery pack out of AA size nicads, just
be sure to save the old connector from the old pack as these
connectors are hard to obtain.
W.W. used to have replacement packs(they advertise in
all the ham magazines).

You may already checked this, but did you check the battery compartment door underneath the radio and make sure the bottom is making good contact? My VX-1r used to cut out when I would set it down sometimes on a hard surface, I traced it out to a flaky connection on the door. Good Luck

For Sale: FT-901DM hf transceiver, with matching FTV-901R
6m/2m/uhf transverter. Both units have been well taken care of and are
fully operational. The 901DM is truly in the excellent condition
category. The FTV-901R cosmetically has several rub marks (back edges),
and a few superficial scratches on the top cover (face is unmarked).
$500.00 - 901DM
$200.00 - 901R Transverter (144 mhz module eqpt'd, 2 slots open)
(asking prices are in $USD + shipping)

Thanks & 73!

Greetings. I just picked up a used Kenwood TM-732 dual band mobile. Unfortunately it has a problem. On the UHF side it is deaf in the hamband. Outside of the normal hamband it hears fine, very hot in the 800-900 mhz range. Anyone ever run into this before. Is it something I can fix or does it need to go to the doctor?

Thanks,
Ed

I have a Mitrek in the 2m range complete with head
and cables and three freq. modules.

I am looking for a kit, a design for, an already built, or
recommendation for a readily-modifiable VFO so that I
can free the rig from freq. modules ... anyone know of
such a thing?

If not, anyone know what the requirements would be to
implement a VFO for the Mitrek in the 2m range? Any
gotchas?

Thanks! & 73,

In the back right corner of the IF unit mounted on the aluminum rail is
a 7805 Voltage Regulator. Replace the cap on the input and on the
output. A 1uf and a 47uf if I remember correctly.

Don't foget Spark Gap. For those of you who do not know what DX is; it
means receiveing a radio/television signal from far away. From far away
as in you usually do not get a signal from this place. DX can also mean
how far your siganl is getting out. From everything that I read; if you
can run just 10 watts, and your siganl is getting out 300 to 400 miles
then that is better DX then somebody running 1000 watts and doing th
same thing.

4 element tri-band beam. Rotor.

Located in Saratoga Springs, New York. I'm moving to New York City and my mom wants it out of the backyard. Make an offer.. I'd hate to see it taken to the junk yard.

In the back right corner of the IF unit mounted on the aluminum rail is
a 7805 Voltage Regulator. Replace the cap on the input and on the
output. A 1uf and a 47uf if I remember correctly.

I had to install one chip on the inside and add an external interface. The chip on the inside is a standard ttl chip (I think). The external interface that I use is made by DX Solutions, a company that is no longer in business. I believe that it is merely a digital level translator. If you wish, I think I can dig up a schematic and send it to you.

First of all I have a commercial pilot's license with airplane single and multiengine land and instrument ratings. I have been flying since 1967. I own and fly a Baron. No I didn't have to learn Morse to identify navigation aids, the CW is printed right on the chart or approach plate. The statement "don't know of anything used in flying their planes that would need to recieve (sic) morse code for any reason" is fascinating. What do your friends fly? Ultralights? What are their license numbers? Mine is 1774847. My Baron's call sign is N502TB. When you tune in an NDB, a VOR, or an ILS you are taught to listen to the CW identification to confirm that you have the correct station. This takes more time if you have to look at the chart or approach plate to see what the CW is rather than just hear the ID.

Source record: 107649
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

There was a pretty neat ICOM dual-bander with a full-color LCD readout that also doubled as an NTSC video display. They had a video camera hooked up to it and it produced some pretty nice pictures.

Then there's Kenwood's VC-1 visual communicator that had a video camera and display and I believe fast scan capability as well as slow scan for HF. Think it was out somewhat before Dayton, tho.

Also, the guy doing the packet forum was turning handsprings over Kenwood's handheld (also out before Dayton, I think, but first time for me to get an eyeball on it) that has the built-in packet modem. Am still not sure of the details, but think it's set up for APRS. Cool.

Didn't really search for latest/greatest because it would have been stuff more expensive than I wanted to fool around drooling over. The MFJ line is getting absolutely huge now, and I got their little in-line filter for eliminating the paging transmitters that tears up most 2M receivers nowadays. Haven't got it installed yet. Been dead-run-busy, plus sick, this week. (Still doing better than one of my friends who went to the hospital with appendicitis, however...)

Dave Head
K8DH

PS - Ham Radio _AIN'T_ dyin... Manufacturer's sales keep going thru the roof... look at all the stuff MFJ has come out with... Ham Radio may be CHANGING, but it isn't DYING.

I have two Intermarine HF amps to trade or sell. Both have three 8874's,
very low hours, 4' cabinets. They are auto tuned with loads of relays and
series/parallel switched caps in the tank. Tanks need repair, tubes and
supplies are good. Looking for a decent desktop amp in good working order.
Designed for 1500 watts RTTY shipboard use.
Chicago area / suburbs only.

Also have a set of International Radio Co. SSB filters for TS-940.

Reasonable offers considered..

Hello. I have a Kenwood MC-60A desk mic with the built-in pre-amp for sale. The mic works 100% and cosmetically it's around a 9/10. There is moderate use on it with no problems at all. Comes with the mic, base stand, manual, and all necessary cables.

Has lock, PTT, channel/frequency up/down, and dual-impedence selector. Wired for 8 pin female connector. First $100 gets it (that includes the mic, UPS ground, and insurance). I will also trade it for a Heil Pro-Set or like mic. Thanks a lot for reading.

Is anyone using the MFJ 9040 qrp cw station? How do you like it? I just ordered one myself and would like opinions. I hear it's a nice rig.

73,
Tom

How about a little description of the radio - what is "AS IS" condition???? Is the radio working OR not???? Is there a tone board installed in it???? Does it come with a mic????
You got to leave some sort of description, so we all know what kind of junk you are selling... ROGER THAT??????

4610. Q:VX-5 6m performance.

Message-ID: <01bea486$64f1e560$d2fe1f0a@ntsrv01>
Source record: 107484

hello,

I bought a VX5 at dayton, my first 6m radio. But I'm wondering if there's a problem with it, or if 6m performance on an HT is supposed to be lousy. The first thing I noticed is the radio is relatively deaf on 6m. Then it was tested with another VX5, we got only about a block and a half away before both radios couldn't hear the other. Has anyone else had either similar or different results with thier VX5?

Thanks in advance,
J.Motyl

4611. IC-706 front panel broken - need help

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-22 00:00:00 UTC
From: hamnospam@aol.com
Message-ID: <19990522152700.03866.00003585@ng-cr1.aol.com>
Source record: 107485

The clip that clips the front panel onto my IC-706 was broken by some gorilla baggage handlers yesterday. (The radio was packed in the CENTER of a large hard sided suitcase!) The clip apparently had a little spring inside it, and that spring is now bouncing around inside the control head. I'm on vacation and I'd love to get on the air, but I don't dare turn the rig on until I've extracted the spring.

Anybody know how to dismantle (and re-assemble) the control head of and IC-706? I'll look for postings in this group, or please e-mail "hamnospam@aol.com". Also, is this a known weak point in the radio?

Thanks,
Brian McMinn, WE5TX

Yes, the "nospam" part really is part of this temporary e-mail account!

Hi Ken,

I have also experienced this on the FT-100 and wonder if you could give
me
the circumstances that you experienced the 10 meter SW (type of antenna
original frequency of SW station, 10 meter frequencies or any other
useful
info). I am writing a review on the FT-100 and have been discussing
this problem with Yaesu and am still gathering
data.

Thanks es 73

Too Late..... I bought one.

It works very well as a small receiver but the 200mw output is just not
strong enough for anything but hamfest simplex operation.
You can hook up a 9 vdc power source and get a respectible 2 watts out.
It would be nice if they offered a larger power pack option.
The two AA batteries will lase about 3 days of just monitoring.

I guess for about $100 more I could have got a nice tri-band 5 watt radio.
Yea pays your money and takes your chanches.

BTW Anyone got any land down in Florida for sale? I seem to be a good
prospect for a great deal on some swapland.

William Lee N5WRX

Ken, my FT-100 would recieve AM Broadcast Audio on 1.800 meg. and at my
home here in Little Rock, AR was so noisy that it was unusable.
I might have not had it adjusted right but I sold it 2 days after I
bought it. The ham I sold it to after 2 weeks of use, just reported back
to me that it has totaly discombobulated, it has no recieve and only
half output on all bands...
Anyone else have this problem?

The FT847 was picking up really bad interference from a nearby BC station on 1510 kHz (when connected to the 40-2CD yagi here about a mile from the station). Looking at the antenna input I saw about 2V pk-pk RF at that freq. A trip to Yaesu claimed to fix it but no difference (some diodes in the front end were changed). A high pass filter would fix it but I was rather disappointed in the rig for that reason. I wonder if the front end of the 847 and 100 share any of the design features, and if that's the case, would your FT100 have benefitted from a high pass filter in the antenna line?

Apparently not any more. Neither of my friends ever HEARD of this BS
and they both have licenses and fly planes. Perhaps back in the 60's
things were different.

4633. FS: Heathkit SB-110 W/Power supply

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-22 00:00:00 UTC
From: "LONNIE . MOVIUS" <NT6B-VK7LM@DREAMSOFT.COM>
Message-ID: <374773C7.45E62508@DREAMSOFT.COM>
Source record: 107507

This Heathkit SB-110, 6 meter rig was purchased from the original owner/builder and it has the original matching power supply, with dual voltages for high and low final amplifier settings of the 6146 tubes. I have owned it for several years but it has been unused for about 7-8 months. The rig is very ,very clean inside and out, non smokers. This radio is being sold without a mic. The chassis has 2 small scratches on the top but would be easily touched up. Other than that the chassis is in excellent condition.

This rig is original in every way (No modifications whatsoever) and it is cosmetically a beautiful, classic rig. Have purchased a new quadbander so this rig is excess to my needs. I have the original Heathkit manual for the rig. $400 (Firm) plus shipping from 92570. Sorry, No trades.

If your interested contact me through my email address only...

Thanks for reading my listing.

73's....Lonnie (NT6B)

Right now. Right here. You don't know anyone in aviation. I flew my last IFR cross country Thursday. Damn if the Centex VOR didn't go _. _. ._ _ _._ "CWK". Then the Waco VOR went ._ _._. _ "ACT". Then the Waco ILS went .. ._ _._. "IACT". The Navaids that don't do it (CW ID) are LORAN and GPS. Pack up any sectional aeronautical chart or approach plate and the
CW is printed next to the Navaid identifier. That's the last for your troll, wankstain.

Message-ID: <RNA13.207$I7.2747@iad-read.news.verio.net>
Source record: 107512

Hello. I have a Radio Shack PRO-2035 base scanner for sale. The scanner is at least a 9/10 cosmetically and it works 100%. It has very, very low use, and I've had no problems with it at all. It has 1000 memory channels, one touch weather, VFO knob, NFM/WFM/AM, RF ATT, RX from 25-520 and 760-1300 MHz (minus cellular), keypad, and data skip. This scanner can even be modified so that it can receive VHF/UHF in CW/SSB in addition to FM/AM if you have a SW Receiver, but I have not modified it for anything.

The scanner comes with the indoor telescopic antenna, AC power cord, base stand, original box, original packaging, and the original manual. First $310 gets it (that price includes the radio, UPS ground, and insurance). Please let me know if your interested. I would trade for a Ten-Tec 253 HF auto-tuner or like model. Thanks a lot for reading.

Hello. I have a Kenwood MC-60A desk mic with the built-in pre-amp for sale. The mic works 100% and cosmetically it's around a 9/10. There is moderate use on it with no problems at all. Comes with the mic, base stand, manual, and all necessary cables.

Has lock, PTT, channel/frequency up/down, and dual-impedence selector. Wired for 8 pin female connector. First $100 gets it (that includes the mic, UPS ground, and insurance). I will also trade it for a Heil Pro-Set or like mic. Thanks a lot for reading.

Ihara-san,

Depends on the rotor, but I will come and pick it up for $100.

You mention tower in the subject line. What is it. I will pick it up at
the saem time as the antenna and rotor.
What to you want for it?

I am only 3 hours away.

I like sashimi a bit better than sushi, but I like them both.

Hi David. It really depends on what kind of satellites you want to work. You can work Mir with a simple ground plane antenna, a 2 meter rig and a simple TNC. You can work AO-27 with nothing more than a HT and a whip antenna. I suggest that you start working these easy satellites and see if you still stay interest in working the birds before you spend a lot of money. I also suggest that you visit the AMSAT-NA web site at http://www.amsat.org where you can find tons of helpful information.

Good info! However, if any troops are looking for a long-term rig for MARS or CAP, the unit does not comply with NTIA* stability requirements for HF (<.67ppm or 20 HZ)) nor does is comply
with either narrowband or wideband requirements for VHF. I contacted Yaesu and they said there
was no plan to provide a .5ppm TCXO (unlike the FT990 and FT1000/D or the Icom 706-series). Seems like an unfortunate decision.

* CAP and MARS now under NTIA, vice FCC.

I don't know if they are still around, but GLB used to make a
synthesizer kit. It selected TX and RX frequencies separately.
You could also select reverse at the flick of a switch. I used
one on a Mocom 70 for many years.

Sorry I couldn't be of more help. I think the synthesizer would be
much better than a VFO, as at least you could then use any
repeater in your area.

Take It!! The v7a is a much better radio in my opionion. Among other features, if you like viewing both bands at the same time, dual inband recieve such as v/v and u/u and crossband repeat. The g707 doesn't offer that. Get the tmv7a!!! Scott, n0oba.............I have had two and they are great.

Considering that most hams shop around before they purchase... most everyone, even newly licensed operators know of places like Ham Radio Outlet and other popular suppliers..where they can get a whole lot more for the money.. I would hope that nobody will buy that useless piece of crap... which is what it is in comparison to the $$ Radio Shack wants for it.

Yaesu tech support told me there is no way to erase memory - only overwrite, skip scan, and mask. Makes the feature to point to next empty memory increasingly useless after a while.

I don't have any software for this yet, but RT Systems told me their software will enable you to erase a memory location.

Does anyone know if it can be done directly on the unit?

Also, the manual does not say how to unassign a memory location from a memory group. (Repeating the process of assigning does not unassign.)

Does anyone know if it can be done directly on the unit or with any software?

Hi

I just ran across an antenna named "big wheel". The only
design info I've been able to find so far is in German.
Unfortuantely, my ability to read/speak German left me
20 years ago. Could someone point me to some info
on the net that is in Engrlish?

Bill,
I have a Pryme remote speaker mike (IMHO better than the factory mike),
the battery case that holds alkaline batteries in case my regular pack
goes dead and I need "emergency" power, an SMA to BNC converter for
external antennas, the 12V charger to recharge the radio in the car and
a case to protect the radio.

Have had this tuner about a month, used it only to test, don't need it. 300 watt capability, tunes 160m-6m and everything in between. T-network with roller inductor matches just about any load. Includes metering for peak and average power out and reflected power/swr. Built-in 4:1 balun, dummy load, lighted meter, connectors for 2 coax antenna leads, a 2-wire lead, and a 1-wire lead, plus bypass position. Includes manual. Cost $180, sell for $120 + a little to ship. Jan N0JR

Personally, I only use 2m and 440 repeaters - don't know of any 10, 20, 40 or 80m repeaters, let alone ones with autopatch (many of which require affiliation with a local club before you can use them).

Do you want to use it from home? Car? Both? IMHO, an H/T provides the best of all worlds: use it at home or throw a mag-mount on my car and I'm mobile.

I guess it depends a lot on where you are. I have a Yaesu FT-50R that I wish I'd never spent the money on. Here in the Cumberland Mtns of TN, the only traffic on 2m is an emergency net call in (Frozen Head repeater on Sun & PARC repeater on Wed). Otherwise the 2m band is mostly deserted. I've never EVER heard anything on the other band... waste of money to be there at all.
I do the rag chewing on the internet because it CAN get out. Radio is pretty limited. Hope this helps. Johnny KF4WWF Wild Wood Flower

4677. TS-60 battery replacement

4683. Car (?) battery for a mobile radio

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-23 00:00:00 UTC
From: Jack <707812@ican.net>
Message-ID: <37488AC7.3A57@ican.net>
Source record: 107445

I'm looking for a battery for a 50-60 W mobile radio. However, I was told that ordinary car battery is not very good since it is not designed to be discharged and re-charged on a regular basis. Somebody has suggested that I purchase a smaller battery for boats or lawn mowers that supposedly is designed for charging and discharging.

I'd appreciate any comments on this topic.

Thanks,

Jack

4685. TS-440 distorted SSB receive and no xmit

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-23 00:00:00 UTC
From: turner@rome.ics.uci.edu
Message-ID: <9905231644.aa13467@paris.ics.uci.edu>
Source record: 107447

Hey guys:

My beloved TS 440 has just gone dow on me. It was operating as normal in SSB receive when the volume went way down and the signals sounded a little distorted, like using an AM detector with a BFO instead of a product detector. I checked other functions and the transmitter has quit. Nothing out at all. Not in CW or AM.

It receives find in AM and FM. Just very low volume and distortion on SSB and CW. LSB and USB the same.

Any thoughts on this? I thought right off the bat that the product detector diodes went south on me with the SSB receive problem (I have some schottky's here I would put in there) but the lack of transmit has me stumped. Is the product detector used as a mixer for the transmitter? Or is there another likely candidate in the line for both SSB receive and all modes transmit?

All help appreciated. The 440 is up to cover for my 850 which is waiting patiently down in Irving, Texas to get back on its feet. Hate to be off the air, I'll need to bring my 830 up (which was in the closet with some half done work to it, aaack.)

All I really want is to be able to get my license, and so as my wife and set up a radio on each other vehicles and at the house so when we go separate ways we can still stay intouch with each other and if we go out of range, so we can use the repeaters to make telephone calls in case something happen. Is that possible? What kind of radio would do that?

All I really want is to be able to get my license, and so as my wife and set up a radio on each other vehicles and at the house so when we go separate ways we can still stay intouch with each other and if we go out of range, so we can use the repeaters to make telephone calls in case something happen. Is that possible? What kind of radio would do that?

I'm trying to take the technician license exam on June. I'm doing this besides a hobby, also to be able to communicate with both cars in the family and the house and also among friends in Florida that has HAM radios also. I would like to know if there is a radio that will allow me to have access to the frequencies that I would be entitled once I pass the exam and if those frequencies will allow me to talk at least within a couple of hundred miles away. I'm not looking to bounce signals off the moon or anything like that, I just want to be able to use the radio to communicate for example from Orlando or Tampa to Jacksonville, and also to be able to use the repeaters so if I want to make a phone call from the radio I can. Will the VHF and UHF that a technician is authorized to use will allow me to use repeaters, talk a long distance and make phone calls. I'm planning on running 200 watts of power. Can a Galaxy radio do any of these things? The reason why I ask this, is because I like the format of the Galaxy radios, (buttons and knobs, not pushing buttons). I would really appreciate your help with this since I'm kind of new the HAM hobby and still studying for the test.!!! :)

If you are out of range of the repeater, you are out of range for the
autopatch as well...

What kind of range are you talking about here? And if you are both mobile,
whom would you dial on the autopatch? Is there even an autopatch available
for your area? If not, are you willing to invest the money to install one?

Keep in mind that there will not be a frequency available for you and your
wife to declare as "your own"; I have no idea how heavy traffic is in your
area - it may be that the frequencies and repeaters you would be using are
under almost constant use, in which case they may not be available for your
instant use to report an emergency regarding dwindling supplies of dog food
(if that is, indeed along the lines of "something happening").

The rules of operation for autopatch should also be considered: remember
that lengthy conversations are frowned upon, and the entire world can hear
all of the details of any family emergency which may arise: on the amateur
frequencies there may be no "private" conversations - tone squelch is as
"encoded" as you are allowed to get: and let's face it "honey, the kids are
going to have to wait alone at the park for 20 minutes until you get there"
may not be exactly information you want to pass along to every guy with a
scanner.

Amateur radio is wonderful - don't get me wrong, and I heartily encourage
you to obtain your license and delve in and enjoy. However, please be aware
ahead of time just what limitations to the service are out there and may (or
may not - who knows? Maybe I'm entirely off base here) throw a wet blanket
on your plans.

I really appreciate your info and honesty. I will definitely will keep this in mind! Also, if I get a 10 meter radio like the Galaxy 77hml and have the 11 meter modifications made to it, would I be able to access what they call the freebands? Also, talking CB, what difference makes the SSB (Lower Side Band, and Upper Side Band, same thing right?) when it comes to noise and static on the channel like when you turn the regular 40 channels ones on and hear all the interference?

Kenwood TKR-820 Desktop Repeater with Internal Cel-Wave Duplexer. The repeater is a 2-20 watt commercial unit. The power supply is built in and also has a 12VDC input for emergency automatic backup power. The repeater has a CW ID installed. There is also a Full Duplex CS-800 Interconnect/Repeater Controller which is wired to plug into the accessory plug on the rear of the repeater. Currently the repeater is programmed for 444.500 / 449.500. The repeater can be setup to operate from 8 different CTCSS or DCS codes (can be mixed). The TKR-820 is type approved for GMRS, Commercial, and Ham. The repeater is the same size as a Kenwood TS-850S HF rig. It is about a year and a half old and is currently in service. I also have 1 new and slightly used (2 months) TK-860 UHF - 32 Channel radios with CTCSS and DCS for sale. I also have a DTMF mic for one of the TKR-860s. All of the equipment is in good working order and looks new. I can program the TKR-860 radios to any channel setup required. I will discount for a package sale! Email radio@vvm.com for prices on selected or package items.

I have in very good condition a Sailor Receiver Type R-1119
Sailor Exciter Type S-1303
and 500 watt Transmitter/220V Power supply Type T-1130
These are all rack mount units in great condition and operational when taken out of a cruise ship about a month ago. I have a complete set of manuals with all the technical manuals included. They will require interconnecting wires as they stayed with the rack. All are fully solid state. The exciter has been updated with the new ITU frequencies. The Amplifier/powersupply can be used seperately as a 500 watt output linear amplifier. I have photos upon request. They require 220VAC and would make a very good amateur station. If you need to ask any questions I can give you an address of a fellow ham who is using the very same system and finds it most impressive. The company Sailor is the leading manufacturer of high end communications equipment and also the first global telecommunication network called Iridium. Best offer or trades welcome.

Sounds like PLL unlock to me. Is the display showing all decimals?
I had the PLL problem and Kenwood was unable to fix after one year of many attempts. I ended up selling it broken.

There are people who claim to be able to fix this. Ask on this newsgroup. Someone surely knows of a shop with this experience.

Good luck.

As far as I know, the only U.S. manufacturer to produce a big wheel was Cushcraft, and that was decades ago. You can find some information on it in "The Radio Amateur's V.H.F. Manual" by Ed Tilton, W1HDQ. My version (the first edition) was published by the ARRL in 1965. It carries an ad from Cushcraft showing, among others, a big wheel. On Page 214, under the section titled "Omnidirectional 144-Mc. Antennas", there is a fairly long piece on "The Big Wheel".

More recently, Dave Clingerman (W6OAL) of the "Olde Antenna Lab", 4725 W. Quincy Avenue, Denver CO 80236 phone (303) 798-5926 in 1995 quoted me a price of $400 plus shipping for a 6m Big Wheel.

Hope this helps.

FS B & K model 600 Grid Dip Meter and full coil pack. This meter is collecter quality, Coils are in original B&W box. This is the bullet shape meter with tuning knob on front and meter on left side. Has a piece of yellow tape
near top above meter with small scratch in corner of tape. Has very small scratch (less than 1/16 inch) above 90 to 100 mhz on outer edge of dial in pink section for coil 600-A-5. Coil pack is in original B&W box which is perfect. Yellow (600-A-3 14-36 mhz) coil has a few scratches and White (600-A-3 5-14 mhz) coil has 2 small (less than 1/8 inch) scratches on it. Thats it! otherwise perfect as when it came from B&K years ago Serial number 3384 Works great! Reason for selling is I use it and want to buy a MFJ-259B to replace it. Make an offer. No reasonable offer refused.

4708. HT1000 Programming Help

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-23 00:00:00 UTC
From: "J. Banks" <psgtech@ix.netcom.com>
Message-ID: <7i7jc5$jf7@dfw-ixnews8.ix.netcom.com>
Source record: 107516
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Can anybody provide some help regarding DTMF on a HT1000?

I just received two new HT1000's with DTMF. I can't seem to enable the DTMF pad (pad is dead, no click tones or anything).

I've gone thru the DTMF options on the Signalling Menu, but still nothing. I must be overlooking an option somewhere, but I can't seem to find it. I have a feeling I'm missing something in the singletone or sidetone options. Any help would be appreciated!

Thanks,

Jim

Hello,

Looking for Ham IV Controller Unit.
Unit is black in color, and 8 wire type.
If you have one you want to sell, please email
me at wd5bjq@bigfoot.com

I can also us the CD-45 Box, from what I have seen
on various rotor repair websites.

Thanks
Keith

I have in very good condition a Sailor Receiver Type R-1119
Sailor Exciter Type S-1303
and 500 watt Transmitter/220V Power supply Type T-1130
These are all rack mount units in great condition and operational when taken out of a cruise ship about a month ago. I have a complete set of manuals with all the technical manuals included. They will require interconnecting wires as they stayed with the rack. All are fully solid state. The exciter has been updated with the new ITU frequencies. The Amplifier/powersupply can be used seperately as a 500 watt output linear amplifier. I have photos upon request. They require 220VAC and would make a very good amateur station. If you need to ask any questions I can give you an address of a fellow ham who is using the very same system and finds it most impressive. The company Sailor is the leading manufacturer of high end communications equipment and also the first global telecommunication network called Iridium. $1500+shipping for everything.

For Sale:
Midland 13-509 Electrically and mechanically it is a 8. Comes with
microphone, copy of the manual and power cord. Has 5 frequencies installed.
1. 223.50 simplex
2. 224.94 rpt
3. 224.42 rpt
4. 224.62 rpt
5. 224.26 rpt
Asking $85.00 plus shipping

Also have ICOM IC 3AT comes with rubber duck antenna, speaker microphone,
800ml battery, ICOM BC 30 drop in charger. Electrical and appearance is a 8.
Asking $125.00 plus shipping

Both units are in good working order. 13-509 might need frequency counter
for transmit and receive crystal alignment. Also if both units go to the
same person for $200.00 plus shipping.

If interested email me at ka0nno@6mt.com
Thank you. Lisa

Mike, I don't think you want to do this. Most electronics are designed with a 50% tolerance margin. Running the TS50 at 2X power is very likely going to blow out one or more critical components.

If you want bigger signal reports, then concentrate on a better antenna system with a GOOD GROUND PLANE. You'd be amazed at the difference this makes.

good luck

4747. A question about radios and emergency power

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-23 00:00:00 UTC
From: ctippins@miamionthenet.com
Message-ID: <374a1b50.59702797@news.mia.bellsouth.net>
Source record: 107555

I recently passed a tech license and I have some questions about ham radios and emergency power.

I'm debating getting a handie talkie such as the Yaesu VX-5R or a mobile such as the Kenwood TM-V7A. (Comments about either of these radios are welcome).

My interests lie in providing emergency communication during hurricanes, which it seems we may see more of this year.

With the handie talkie, I know a simple "AA" battery pack will suffice for power during outages, but I'm concerned about the limited range of this unit (particularly considering that after a storm, most of the repeaters might be down).

On the other hand, the mobile unit would offer me better range, but I want to be able to use this device as a base unit, not attached to a car.

I'm curious what some of you might be using (or have built) to use a mobile type radio during times of extended power outages such as a hurricane and what you do to recharge them (solar?).

Any and all help would be greatly appreciated on these or other solutions you have come up with for transmitting during periods of extended power outages.

Thanks.

Chris

Finding a radio which covers -all- of the bands on which you are authorized to transmit will probably be expensive (if not difficult). Then you'd have to purchase antennas, keyers, and assorted other equipment: get out the checkbook and warm up your pen.

Friends don't let friends use e-bay

Neomorpheous <vergara@thepentagon.com> wrote in message news:ufS0m1Sp#GA.243@cpmsnbbsa02...
I would like to know what radio would be the best buy for my money. I'm planning on taking the Technician Plus exam on June would like to buy a radio that would offer me all the frequencies that I would be authorized to use. I'm kind of new to the Ham radio equipment. I saw a Galaxy radio DX 99V but it says 10 meters radio, and so with every other radio I see out there. Is there one that gives me all the frequencies (80, 40, 15, 10, 1.25, 23 cm, etc) that I would be entitle to use?

Two possibilities!

Someone has rewired the mic connector on the radio. My manual schematic for the 211 shows the pin 2 as PTT and it's taken to ground for transmit.

Someone has rewired the mic connector on the radio and put 12 volts on pin 3 which is usually not connected. Frequently this is done to power a microphone with built in DTMF. Usually this is fed through a limiting resistor. Possibly you might have either inadvertently touched pin 3 while you were tying pin 2 to ground or (perish the thought) you mistook pin 2 and 3.

The best way is to look inside the set.

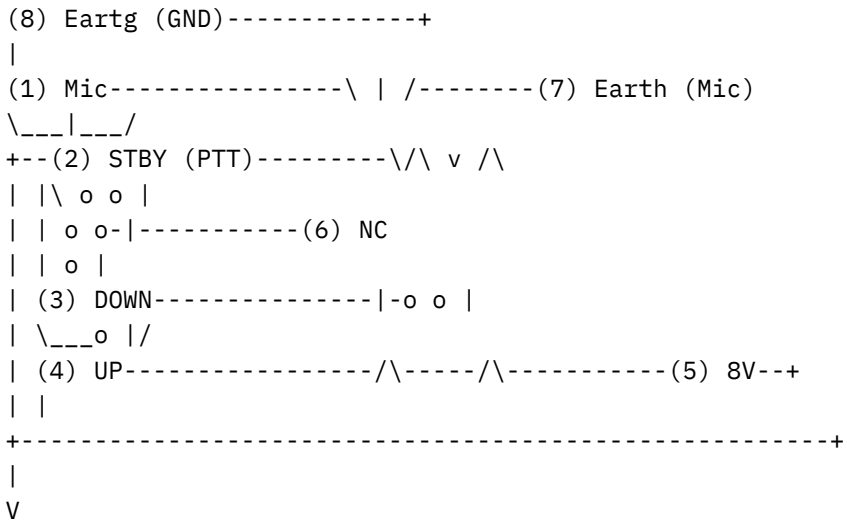
: Bill n1nfc@eagnet.com
:
Apparently the point of view here is looking at the socket from the
front. Here's what I have from the Kenwood TM2530A manual:

(15) MIC connector (8-pin)
For connectiuon of the supplied microphone (and or MC-48 autopatch microphone).



Caution:
The radio may be damaged if an external source voltage is applied to
pins 2 - 5.

I hope this helps.

4767. Re: Put Motorola Sport 7 on amateur band?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-23 00:00:00 UTC
From: johng@comm.mot.com
Message-ID: <johng-ya02408000R2305991415290001@nntp.cig.mot.com>
Source record: 107575

If the hardware is similar to the Sport 10, the single chip controller than runs the thing has a masked ROM and the frequencies are not programmable. (The sport ten does let you switch between GMRS and "Dot" frequencies by moving a jumper) You would need to change out the uP and write your own code to control all radio functions. After this you would have to retune the radio front end and make sure that the synthesiser would lock and the PA would put out sufficient power in the ham band. Sounds like a bit more work than most people would be up for for such a "low tier" radio.

Yaesu also did this with the FT-847. They shipped design defects in the first series of these and tried to fix it "after the fact". As a former Yaesu devotee (I have owned Yaesu's FT-900, FT-1000MP, FL-7000, and FT-847), I'm through with their radios because of this shabby practice. I don't care to constantly have to go through the hassle of shipping the radios back to them to fix "bugs" that should have been fixed in the first place.

Sounds like the filter capacitors in the power supply area. Look
around and see if you see any rated at 40 MMF or more and 250 volts
or higher. It might be in an aluminum can about an inch in diameter
and 3 inches or so high mounted vertical like the tubes, but not
plugged in. The standard fix for the old stuff is to replace all
the electrolitics and if it is very old and has the old paper
capacitors in other parts, to replace them too.
There is probably a 10 to 30 mmf at around 25 volts on the cathod of
the audio output tube. This will affect the volume of the radio if
it is bad, especially teh low audio frequencies.

JJ:
Before you start lumping all of us Chicken Banders into on pile, you might want to rethink this. I've been a SSB CBer since '76; I personally don't use foul language on the radio for any..... reason. None. Nada. and I don't appreciate your suggestion that all of CBers have a low mentality! That is one of the reasons I have not pursued getting a ham ticket, if I want to a join clic-ish society I would probably join the ham ranks. The big me, little you club is not for this person; and did you ever own a CB? A very good number of the very best hams probably held a CB mike before going the whole nine yards and getting thier amateur ticket. JJ, what I am saying is if the ham bands are to continue to grow and flourish; you need new operators. And a good number of those operators will most probably come from the CB ranks. So a careful choice of words would do a whole lot towards attracting people to fill the freqs. that the world community would love to have religated to some other service that YOU would not be a part of. THINK BEFORE YOU SPEAK JJ!!!!!

4792. RCI2950 to 6 meters?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-24 00:00:00 UTC
From: Bill <whagen@NOREPLY.inreach.com>
Message-ID: <3749FFCC.20D1@NOREPLY.inreach.com>
Source record: 107251

Has anyone seen plans to convert the RCI295 from 10 meters to 6 meters?

Source record: 107253

FS B & K model 600 Grid Dip Meter and full coil pack. This meter is collecter quality, Coils are in original B&W box. This is the bullet shape meter with tuning knob on front and meter on left side. Has a piece of yellow tape
near top above meter with small scratch in corner of tape. Has very small scratch (less than 1/16 inch) above 90 to 100 mhz on outer edge of dial in pink section for coil 600-A-5. Coil pack is in original B&W box which is perfect. Yellow (600-A-3 14-36 mhz) coil has a few scratches and White (600-A-3 5-14 mhz) coil has 2 small (less than 1/8 inch) scratches on it. Thats it! otherwise perfect as when it came from B&K years ago Serial number 3384 Works great! Reason for selling is I use it and want to buy a MFJ-259B to replace it. Make an offer. No reasonable offer refused.

Dave,

I've used the software with my FT-51R and agree with you completely. I wasn't sure if it handled memory groups on the VX-5R, but assumed it did because it overwrote all memory. Called RT Systems today and they confirmed it did.

Still would be nice to be able to erase memories and unassign memory locations from a memory group without needing the software.

4807. FT-100 AM performance

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-24 00:00:00 UTC
From: headhamster <headhamster@erols.com>
Message-ID: <3748FBC0.7508BBA6@erols.com>
Source record: 107383

I just purchased a new Yaesu FT-100. I love the radio, but found one disappointing performance feature. I enjoy SWLing as well as hamming, and unfortunately the AM selectivity is horrible. I see that Yaesu sells a 6kc AM filter for the rig. Has anyone tried of these in their FT-100, and if so how much did it improve the AM selectivity?

IT is
The US radio had a lot of problems up until a few month ago because FCC required different firmware it had a lot of bugs.
I disliked Yaesu and was a die hard Icom fan. Not becaus eof their equipment but the Australian Agent SUX!!
I got my VX-5 from Singapore and its great. If you can mailorder yours from Europe or Asia. Get a type B3 and you will have no problems. Its far better you just cant compare the old technology of the ft50, its had its day and now its time to get rid of it!
I have the Icom IC-T8. The radio that Yaesu is competing against with the VX5 The T8 is a good radio, but the 5 is smaller lighter and has heaps more battery power while being 5W out of the box.
The Icom does have a much more sensitive RX out of band and it does have 30kHz steps for that 800MHz band the 5 does not.
Give yout ft50 to a young new ham to get them started and look at a VX5 or an IC-T81 quad bander.

Cheers
Eric.

Kenwood TKR-820 Desktop Repeater with Internal Cel-Wave Duplexer.
Therepeater is a 2-20 watt commercial unit. The power supply is built in
and also has a 12VDC input for emergency automatic backup power. The
repeater has a CW ID installed. There is also a Full Duplex CS-800
Interconnect/Repeater Controller which is wired to plug into the accessory
plug on the rear of the repeater. Currently the repeater is programmed for
444.500 / 449.500. The repeater can be setup to operate from 8 different
CTCSS or DCS codes (can be mixed). The TKR-820 is type approved for
GMRS, Commercial, and Ham. The repeater is the same size as a Kenwood
TS-850S HF rig. It is about a year and a half old and is currently in
service. I also have 1 new and slightly used (2 months) TK-860 UHF - 32
Channel radios with CTCSS and DCS for sale. I also have a DTMF mic for one
of the TKR-860s. Also have 2 UHF Kenwood TK-350 (With DTMF PAD) and 1 VHF
TK-250 Hand-Helds (160 channel) with new NiMH batteries. All of the
equipment is in good working order and looksnew. I can program the TKR-860
radios to any channel setup required. I will discount for a package sale!
Email NO-SPAMwb5tty@vvm.com for prices on selected or package items. DROP
NO-SPAM from email address!

Hi there... I'm an electronic musician seriously looking for electronic musical equipment from the 1960's-80's, in any condition, BROKEN OK:

- SYNTHESIZERS
- KEYBOARDS
- DRUM MACHINES
- VOCODERS
- EFFECTS PROCESSORS
- ANALOG SEQUENCERS
- ANALOG MODULAR SYNTHS (full systems or individual modules)
- MIDI GEAR

Knobs or slider controls preferred but not necessary. The older or more unusual, the better.

Moog, ARP, Roland, Sequential Circuits, Oberheim, Korg, Roland, EML, EMS, Buchla, PPG, Aries, Steiner-Parker, Tonus, Ionic, SMS, Maplin, Yamaha, Simmons, Voyetra, Octave-Plateau, Bode, Polyfusion, Serge, Delta, Emu, Sennheiser, Mutron, Maestro, ElectroHarmonix, Electronic Music Laboratories, Electronic Music Studios, ANYTHING SIMILAR.

Roland TB-303 Computer-Controlled Bassline
Roland TR-909 Rhythm Composer
Roland TR-808 Rhythm Composer
Roland TR-606 Drumatix
Buchla Music Easel
Buchla Electric Music Box
ARP Sequencer
Oberheim Xpander
Memorymoog
Minimoog
ARP 2500
ARP 2600
Korg MS20
Simmons SDS7 / V drum module only
Simmons SDS6 drum sequencer

For a better idea of what I'm looking for, please visit:
http://members.aol.com/rolandman1

Please email me at rolandman1@aol.com if you've got anything you'd consider selling or know someone who might. Please be sure to include price and condition. Thanks in advance and apologies if this message annoys anyone.

David,

One of the easiest sattelites to work is RS12/13. You can find a lot of info
at www.qsl.net/ac5dk/rs1213/rs1213.html

73s,
Tom

4819. Sound Blaster Multimode for Windows?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-24 00:00:00 UTC
From: Louis Sica <lsica@visi.com>
Message-ID: <374961C1.E3B7DAB6@visi.com>
Source record: 107395
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

Here's my dream. Does this even exist?

A program that works through Windows (*not* just one in a DOS box) that uses *any* sound card in Windows (*not* just one that uses SPECIFIC hardware calls to a CERTAIN type of sound card only) that will receive *and* transmit CW, and various digital modes (RTTY, ASCII, TOR, PSK, etc) *without* relying on external hardware.

Am I dreaming? Does ANYONE have such a thing?

4820. Kenwood TS 850S w/CW Filters on eBay

Kenwood TS 850S with YK-88C-1, and YG-455C-1 500hz CW filters.
Includes box, manual, hand-mic and power cord.
This is a great CW rig, in great shape. $900

Yes, the 706 is a cool little package, but not a world class receiver.
C'est la vie. I use a Scout mobile; less knobs to keep track of in
traffic. 8^)

The K2 has about 20 transformers and coils to wind, for 80-10m. Two more
for optional 160m/rcv antenna. Kit takes about 50 hours to assemble.
It's actually among the best rigs I own, and lots of fun to operate.

Hi, I took a very close lightening strike early this morning (thankfully not a direct hit). I feel asleep with my TS-850S/AT on and the result is predictably not good. I live an apartment, so the antenna it was connnected to was inside. The radio still functions, but the receiver is a different story. I have had a bad experience with Kenwood's service center in virginia beach, va and I'd like to avoid using them if possible. Any suggestions on where to get the radio fixed?
Thanks
Mike, who is also using the new modem he had to buy.

If memory serves, the 709 is a UHF HT...the FT-290, however, is the radio you described...2m all-mode portable...a "back-packing" type of rig. Mine has a shoulder strap and an internal battery compartment...8 'C' cells...it's one of the original ones...not the MkII model...$125 and you can have it...never used it on SSB or CW...may need aligned, don't know.

Cheers,
WI8D

Why would anyone want to spend the big bucks for a 10m radio and have
it converted to CB? Why not just get a basic CB at local Radio Shack
for 50 bucks?

Just get a couple of 2m radios and use the local repeaters.

Hi,
I have 3 of them and I love them. They have more features for the price than the FT-8100 which I own also. Some people have trouble seeing the display in bright light but I haven't experienced that. I have many friends with it and they are happy with it also.The audio on them is a little on the tinny side and I have a desk mike on the one in the house which makes it sound great. Good luck

John Fields <jsf@REMOVETHISjsf.com> writes:

>I don't have any software for this yet, but RT Systems told me their
>software will enable you to erase a memory location.

The ADMS software writes new contents into *all* of the memories in the unit at once - including the VFOs as well as the main memories. Any slots that you have not programmed with the software are indeed marked "empty". But there is no way of writing just selected locations, you have to load the entire memory.

You can transfer the radio's contents to the computer, edit it, and transfer back. That's generally the way to do it. I hardly remember how to program frequencies manually on my FT-50 anymore - if I want to enter more than one or two new frequencies I do it with the computer. It so much easier to use a real keyboard and mouse to program all the aspects of a single memory channel (RX freq, TX freq or offset, power level, tone/DCS status, alpha ID, etc) than it is to do it with the radio's keypad and menu system.

I want to buy a dual-band mobile but I am first seeking some
advice from the knowledgable users of this group.

So far I am looking at either an FT-8100R / IC-207H / IC-2800H /
TM-G707E / TM-V7E. The main criteria really are a good display and an
extended AM/FM RX for those quiet days.

Does anyone have any good or bad reports/advice on any of these
rigs before I spend my wifes money ?

If you can spend about 650-700 dollars the kenwood ts-440, ts-430, Knwd ts-140, Icom 730, 735 etc. you will have an all band radio. Get the ones that have the antenna tuner built in. will save you dollars on a tuner up front and a simple dipole antenna cut for 80 meters will tune 80-10. A bonus on some of these rigs is that they have continous tune from 100khz to 30 megahurtz. Shortwave listening is fun also. Shop and as questions and allways be aware that this is the enternet. People don't allways tell the whole truth etc. additional warnings etc.....when buying sight unseen.

Greetings,

I have a RCA-Victor tube radio. I replaced all of the tubes, and when I plug it in there is a "hum". This hum is constant in volume. If the cap was bad, would it do this or would it even turn on? Is this a problem with an amp? Like I said, the hum is independent of volume control and is constant.

I admit to being a novice at this, so any help would be greatly appreciated. Thanks in advance!!

Source record: 107425

Hello. I have a few questions about the Kenwood SM-220 Scope that I'm hoping some of you might have the answers to. Please let me know if you can provide any help on any of the following questions. Thanks in advance! The questions go as follows:

-What are the dimensions of the scope, and do you know of any pictures of the scope on-line?
-What type of power does it take (AC or DC)
-How does it connect to a Kenwood radio?
-What is the BS-8 Pan Adapter and what does it do?
-And finally, what exactly does the scope measure? I've heard that on RX it acts like a Spectrum Display (like those found on IC-781, IC-746, IC-756) and on TX it shows you the waveforms of your signal. Is any/all of that true?

Thanks for reading.

BW antennas are popular mainly for beacons. Bought a 2m BW in Germany
for mobile operation, but driving in 100mph with a BW isn't too
practical and it reduces miles per gallon considerably, so I now stick
to the the old J-beam halo aerial with 6dB lower gain - was available
for on 2.50 UK pounds 25 years ago

If you call Yaesu they will "circle the Wagon Train" and try to act as though you are the first one with this problem. Chip margerreti (spelling) at Yaesu USA said the reports are over exagerated but he trying to cover his companies Ass and his Own. I heard from inside sources the reason the Radio took One year from the day it was announced was due to technical problems. I think they then just released it as they knew the Icom IC-706 MK II G model was about to be released. They figured they could fix the problem later and all the failed units coming back (like the FT-900at problem of the radio shutting off on its own.(hee hee). Just ship the radio knowing it has lots of bugs and will blow up . There are many guys on the "onelist FT-100 Forum" who are on their 3rd FT-100.!!! These guys are loyal Yaesu owners who don't care if they have to go through 20 radios to get one that works. A guy at the Local radio shop (I won't say his name to protect his job) said to buy the IC-706MK IIG as they have had very few
problems and the FT-100 come back on a daily basis.
just my two cents,
73's TIM

Very true!!!!!!!
They did this with the VX-5R I had.
I sold it and got a 2nd FT-50.
The VX-5R is a lemon from the get go.
I like the looks of the FT-90 But its a yaesu.
And yaesu is not a very good name anymore.

I would highly appreciate your help regarding the following problem:

I do owe one of JRC's mobile radios under name >> JHM-402S25<< It is UHF

150 Channels radio .!!

and the DEALER code of this UNIT was 22222222 so in order to change

frequencies etc. one should

press arrow UP and simultaniously power on radio .!! after that number

22222222 should be entered

from keypad, from then on it is possible to reprogramm the radio .!!

Unfortunately i have reset radio

and it has cleared its RAM Memory DATA, so now radio has drawn initial

settings from its EPROM

and the DEALER code is not 22222222 anymore, so i cannot access to radios

frequencies anymore and

thus cannot reprogramm it .!!! Can you possibly tell me what is the FACTORY

DEALER code of this

radio so i could reprogramm it or is there any other way to enter into DEALER

mode without

entering PASSWORD thru keypad ????

I find it neccessary to tell you what is shown on the display of the radio when it

powers up .!!

i suppose it is software revision number or something like that ... ??

A-1.02 is shown ??

Please if you can help me in any way i would be eternally thankfull to you cause

i find it REMARKABLE RADIO .!!!

Any kind of Service Manual or Service information would be highly appreciated

regards

Fox

4870. Are you an "HBR" receiver builder/user/aficionado?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-25 00:00:00 UTC
From: robertc908@aol.com
Message-ID: <19990524221533.13702.00003223@ngol06.aol.com>
Source record: 107268

Do you remember the HBR receivers that were designed by the late Ted Crosby, W6TC? There were several versions of these very popular homebrew receivers. The first was the HBR-14 published in the July 1957 QST, followed by the HBR-16 in the October 1959 QST, the HBR-8/11 in March/April 1963, the HBR-12 in April 1964, and the HBR-13 in the October 1965 QST. There were also many improvements and add-ons by others, Alexander Stewart, WA4ZNI and William McKay, W7QBR to name just a few.

Many HBRs were built, and there is presently a small group HBR enthusiasts who are interested in your stories about the HBR you anticipated building, built,
used, or currently use. We would like to know your perception of how well it performed, problems you had with construction, calibration, etc. We're also interested in hearing from those of you curently trying to locate an HBR or if you anticipate building one.

We would like to hear about any correspondence that you may have had with Mr. Crosby, Mr. Stewart or the authors of HBR related articles published in QST and other amateur publications. Also, don't forget Mr. Ed Kent, K8EML, he was the compiler of the original HBR Notes. Did you have any correspondence with him? Tell us about it!

If you are currently interested in building one of these fine receivers we invite you to network with us. There are no fees, we're just a group of HBR enthusiast that help each other locate and obtain the necessary parts, share construction hints, etc.

In summary, if you're an admirer of the HBR tube receivers, then we would like to hear from you.

Kenwood TKR-820 Desktop Repeater with Internal Cel-Wave Duplexer.
Therepeater is a 2-20 watt commercial unit. The power supply is built in
and also has a 12VDC input for emergency automatic backup power. The
repeater has a CW ID installed. There is also a Full Duplex CS-800
Interconnect/Repeater Controller which is wired to plug into the accessory
plug on the rear of the repeater. Currently the repeater is programmed for
444.500 / 449.500. The repeater can be setup to operate from 8 different
CTCSS or DCS codes (can be mixed). The TKR-820 is type approved for
GMRS, Commercial, and Ham. The repeater is the same size as a Kenwood
TS-850S HF rig. It is about a year and a half old and is currently in
service. I also have 1 new and slightly used (2 months) TK-860 UHF - 32
Channel radios with CTCSS and DCS for sale. I also have a DTMF mic for one
of the TKR-860s. Also have 2 UHF Kenwood TK-350 (With DTMF PAD) and 1 VHF
TK-250 Hand-Helds (160 channel) with new NiMH batteries. All of the
equipment is in good working order and looksnew. I can program the TKR-860,
TK-350, and TK-250 radios to any channel setup required. I will discount
for a package sale!
Email NO-SPAMwb5tty@vvm.com for prices on selected or package items. DROP
NO-SPAM from email address!

Yes, they are all simple on my homepage.

http://sm0vpo.8m.com/
http://www.geocities.com/SiliconValley/3569/
http://hem2.passagen.se/sm0vpo
http://members.xoom.com/sm0vpo

Booze, antennas, transmitters, receivers, data, information, kits, even PCB foil patterns to download - Everything for the homebrewer - you name it.

No fees, no registeration, no membership.

Also a technical message board so that you can add technical questions. If anyone asks a question you can help with then please post a reply (it will save me a load of time).

One of the latest additions was a calculator for basic radio formulae but this is just a start. I will be adding attenuators and the like very shortly.

<<< WARNING >>> There is NO sex on the site (except for a rather nice screensaver).

best regards from Harry - SM0VPO

Hi,

I'd like to know if the FT290 (MKII) is capable of CTCSS and
if so, how is this supported. Ie. can the particular CTCSS be
memorized with the memory channels or is it a global setting?
Thanks.

The problem you have with the radio is 60 cycle hum coming out of the front end power supply. it is getting into the bias circuit on the B+ and B- supplies. Check ALL capacitors for leakage, to be safe use replacement cap's that are rated 10 times the voltage of the originals ones. And use New caps always...

> I need to purchase 12 Motorola HT-750's...

The 750 is cursed with a quirky headset adapter...I just used 100 of them for a week-long project, and if you don't take it off and "re-seat" them, your users may experience symptoms as if the battery was dead.

This is the adapter that allows you to use headsets/speaker mikes like those for the GP-350.

The answer, I guess, is to purchase speaker-mikes and headsets specifically for the 750 - if they are available. And, being a proprietary connector, I am sure you'll pay a premium for them.

WHY have you settled on the 750? What does it offer that other models don't for your requirements?

Hello,
I saw some hidden radio's handbuilt inside phones and such
to hide them when I was in Norway. It occurs to me that these
must have been very simple devices. Does anyone know a
good book on basic radio construction. I would like to learn more
about the inner workings of a SIMPLE radio and thus a modern
kit is not really my interest. It would just transmit Morse code of
course, although a radio that received voice would be fun to build
too. I believe at that time they used something called "crystal sets"?
Detailed information is needed please. The radios I saw (used to
transmit and receive Morse) appeared to have very few parts so I
am hoping with the right knowledge it not too hard to build one.
Also, any band suggested for such a radio? Anyone know what bands
were used in WW2 for underground communication? All help
deeply appreciated.

Hy,

It's a dream until now but ...

take a look at CWGET and CWTYPE (CW of course)
IZ8BLY Hellschreiber.exe (Hellschreiber mode)
PSK31.exe (psk31 mode)

They are Windows programs using the sound card with receive and transmit
possibilities.

And IT WORKS.

So it must be possible to do it for other mode.

There is a tone board that goes in the radio. YOu set some dip switches on it for the desired tone. It is not too easy to get to to change the tone. That one tone is used for all memory chanels and the vfo also. It is not possiable to have a differant tone on any of the memory channels.

I did not have one of the tone boards for mine, but did have a small tone board that I was able to squeeze in the main part of the radio and run the wires to the correct places to turn the tone off and on.

From: turner@rome.ics.uci.edu
Message-ID: <9905251457.aa19552@paris.ics.uci.edu>
Source record: 107350

Just to follow up.....

My TS 440 had distorted SSB, but AM and FM sounded fine. The transmitter did not work. The display did not go all dots though.

Clif advised me to check VCO5 for the potting gook problem. Sure enough, there was some awful sludge in there. I cleaned it all up and realigned VCO5 and all is well. About an hour of work.

Thanks Clif, and thanks to others who made suggestions. I am back on the air with the 440.

Didn't your Momma ever tell you not to buy a new product during the initial production runs ... unless you really want to buy something that has not had all the bugs shaken out yet?

FWIW ... I used to work for one of the largest semiconductor firms in the world .... the name is instantly recognizable .... anyway, standard practice was (and may still be) to issue data sheets for with "Prelimiary Information" for all products in production. Only after the products were at the EOL (end of life) would the data sheets drop the "preliminary" qualifier.

Perhaps Yaesu should do the same thing.

Oh ... and another thing ... it was fairly common knowledge that virtually all of the products of that firm (and competitors as well) had some bugs or otherwise did not meet all the "specifications". If you were lucky, known bugs would be detailed somewhere. Perhaps bulding ham radios is something like writing software ... there is simply no such thing as software that is "bug-free".

Cheers,
w7bx@arrl.net

I'm only speculating (I'd like to hear some solid info myself) but a simple radio from that era would have been a single tube crystal-controlled transmitter (using perhaps a 6L6 or 6V6), and a regenerative receiver consisting of maybe a dual triode (detector and AF), or a pentode detector followed by one or two stages of triode AF; or perhaps a regenerative superhet using a converter followed by a dual triode detector and AF. An RF amp may also have been added to the bigger sets for better performance, and to help keep the Bad Guys from picking up the signal from the oscillating detector in the case of the regen. A crystal set wouldn't have had the range for such work, and more importantly it couldn't receive Morse (CW). I'm cross-posting this to the boatanchors group because they're likely to have lots of details.

Paul:

I haven't purchased anything from this company, but I inquired about thier remote sensored RF wattmeter that they show on thier internet web page. I placed a phone call and talked to Paul Hrivnak, the owner of Bramco Palstar Inc.. He was more than cooperative in giving information about thier product and even offered to do some special tuning to lower the rf input requirements to bring it into my needs. Just decided to go another route. He also sent me a whole packet of snail-mail leature on thier products. 73s Al Piper - Artesia,NM

I loaded mine up with accessories, Bill. My favorite is the VOX headset which is handy at hamfests (VC-25).
I also have the speaker mike, which works fine, but a lot of people are buying the Pryme and MFJ mics as well. There is an adapter available that allows you to use the old-style (2 pins) speaker mics with the radio.
Also take a look at the new Comet 510 tri-band rubber duck. It outperforms the stock duck, especially on 6 meters, and runs right at 32 bucks.
The soft case (CSC-73) is rather worthless...there are no cutouts in the case for the speaker mike or battery charger, although it does offer some protection for the radio
Speaking of battery charger, the charging stand is great....it charges my battery in 2 hours. That's item CD-15.
You may also consider a bnc adapter if you plan on using other antennas with the radio. The Yaesu adapter is a rip-off at 8 bucks. I picked one up at Dayton for $2.50.
Finally, get the software and programming cable for the radio. ADMS-1E....it works fine and lets you program the memories and other features of the radio from your computer. There is also some free software called EVE that works great also and lets you do a little more in the programming aspect than ADMS. It even lets you software modify the radio for MARS/CAP if desired.
The last I checked, the Ham Station in Indiana had descriptions in their price lists for all Yaesu accessories at www.hamstation.com

There's also a good mailing list for the VX-5 that can be subscribed to at www.onelist.com
Once you're there, do a search for the VX-5 and you can subscribe to the list. There are some very knowledgeable folks there with a lot of good info on the radio.

I have a Kenwood TS-830S. On the top of the VFO, there is a
piece of "seal tape" (that's what Kenwood calls it). It is like thick
tinfoil with adhesive on one side. It's used to seal the calibration
adjustment holes. Does anyone know where I can purchase some ??? Mine
is losing its adhesive at one end from being peeled back so many
times.

An odd reply. It assumes that people who abide by the law (honor copyrights) are the most offensive operators. It also suggests that if you can get another (perhaps inferior, perhaps better) product for free, the copyright of the commercial product need not be honored.

Perhaps you would bless us with the logic behind those conclusions. Or perhaps you could cite some data, based on your extensive experience in ham radio.

>Is it possible to modify a scanner to transmit on amateur frequencies?
>

Not very easily. You could modify a VW Bug into a Ferrari, but would you really want to? The very fact that you ask leads me to believe you don't have the technical background to build your own FM transmitter, which is what you'd have to do. (Please don't take offense, I don't have that kind of skill either! My skill level with homebrew electronics falls somewhere between dumb and dangerous. <g>)

The thing to do is go out and get yourself a *real* Amateur HT. Most if not all of them have receive-only coverage that is the same, or in some cases better, than a scanner. Plus, you won't have to deal with the expense and hassle of building your own.

Hi,

I am wondering if the UHF/440 ham band is being used at all.

I travel up and down the west coast states fairly frequently, and I don't recall hearing any traffic on any of the published 440 repeaters

up and down the coast;... quite unlike the 2m repeaters.I am wondering if that is the same experience you guys have as well.

I often wonder why I even waste money paying extra for capabilities of

the radio that I can't utilize, expecially all I seem to get on 440 is pure white background noise!

Harry,
AES was/is selling them for $70.00. Have one, used it locally,
Orlando(Fla.), Rochester(NH) and misc. local travel(CT). Usually able to
bring up 3 to 4 repeaters. Turns in a reasonable performance simplex
(considering power output). Battery life is unusual. Sitting in a desk
drawer, not in charger and leaving unit on (auto shutoff on), unit still has
enough charge to use for an occasional brief QSO. Only possible disadvantage
is no speaker-its an earphone(comfortable as that can be). Definitely worth
$70 in my opinion. Even though it may not be listed in the catalog, so call
them to be sure. Phone # 1-800-558-0411.

You can ONLY receive MCW on a crystal set or the OLD raspy spark
transmitters. A pure CW signal MUST have a BFO to beat with the carrier to
produce a tone. Of course you could copy the thumpity thump thump carrier.

Source record: 107194

Actually the TM V7A is a good radio. The only objection I have to mine is the blue display is virtually impossible to read when using the radio in mobile application. I have had mine for two years now using it in base operation and not one problem with it although it is on 24hrs a day.

If the radio looks nice, and works well and the price is right, buy it.

Actually in the Pacific Northwest there are many repeaters on UHF however very few of them ever get enough use to justify their existence.

Two meter activity ihas fallen off tremendously this past year or so, and very little activity is heard on even the wide area coverage repeaters. Pagers, cell phones, internet, or whatever, ham radio isn't what it used to be.

The novelty of the no-code licence has worn off.

Hey Joe,

Here in Salt Lake City, Utah the 440 band is well-used. In fact, I haven't transmitted voice on 2m for over 5 years! I have an FT7400(70cm only) in the truck, and that's all we talk on. We've got 2m and HF links, along with telephone interconnects all on UHF. Why go to back to 2m? When I travel, I put the 2m Alinco DR1200 mobile in the Explorer and a magmount on the roof, just incase. Otherwise it just collects dust on my desk.
Goto www.inconnect.com/~rmra to see what we have. All UHF.
On 2m, portables are pretty much useless unless you're really close and/or have line of sight to the repeater. Sure they work, but they're so darned scratchy all the time. Hence the term "Handy Scratchy".
About the noise issue...well, I think it all depends on your location. Where I am at, the noise is greater on VHF than UHF.
Don't get sour about the 70cm band. TRY and use it. If we don't utilize that VERY important band, we could lose it to commercial interests...

Is it possible to modify my lunchbox to transmit on Commercial
frequencies? :)
ANYTHING is possible. Sure a scanner can be modified to transmit on any
freq. you want, you just have to add a transmitter.
Same goes for my lunchbox! (and a reciever)

All in good fun. People learn more when they are laughing.

I am positive that at least one was 2 way because there was a story with
it that indicated as such. Tube wise I could be wrong-maybe it had tubes.
So you're saying there was no way to build a 2 way radio without tubes
(back then)? Any idea on the simplest possible way to build a 2 way radio
then or now? I know I could buy a kit but I thought it would be more
instructive to
scrounge parts so I would need a good book on the topic I guess.
Any ideas on a reference that details building simple CW transceivers
from the fewest possible parts? I am not looking for DX performance here-
no bells or whistles needed. This is for my education and if I can build 2
units to
send CW back and forth over short distances for practice I would be
one happy ham. Also, if anyone has a source on the behind the lines use
of radio (detailed) in WW2 I would appreciate that. I doubt there are too
many WW2 radio officers browsing the web these days. Too bad-would
be a wealth of information.

From: codeman
Message-ID: <374bd4ba.590273@news2.gj.net>
Source record: 107286

The advice given to you about car batteries is generally correct. The business about a boat or lawn mower battery is aimed at a "deep cycle" type battery. Two six-volt "golf cart" deep cycle batteries will also do the job. Deep cycle batteries are designes to be discharged to a low level and then be able to be recharged back to full voltage without too much damage.

A person can get away with using a car type 12-volt battery if you just plan on having it charged up on a regualar bases and not let it get drained down to a low voltage. I have been using a $17 motorcycle (not a deep cycle) battery on my 50 watt radio at work for the last two years but I also have a trickle battery charger and a timer connected to it so it is recharged everyday on a regular bases.

I presume you are talking about a 2meter/440 mobile radio. Most of the time, you don't need to be on maximum power to effectively communicate. By running on a lower power setting, you just increase the effectiveness of the battery system. If you get long winded some time, then you can reach down and turn the trickle charger on.

Hope this helps. If you are long on car type batteries but short on deep-cycle types, give it a try. You will not be hurting anything but will learn alot. Then YOU will know.

Hi Mike,
Why couldn't you receieve CW on a crystal set? Not enough energy
in the signal I assume? I saw these homemade rigs at the Resistance
Museum in Norway about 7 years ago, which was before I was a ham
so I wasn't paying enough attention. They were VERY basic and not
commercial rigs at all. Basically they amounted to the simplest
possible equipment you could make to send and receive a signal, which
is why I find them interesting. As I recall they had 2 or 3 examples, all
very small. I do not remember seeing tubes, although it was a while ago
and it could just be my bad memory.
Thanks for your post,
Eric

Has anyone experience using SGC wire tuner SG-231 with transceiver FT-847?
Required additional interconnect between tuner and TRX or enough RF cable
only? I'm looking for tuner to use it with random length wire to operate
mobile and take somebody's advise.

QST did a comparison review of the Centurion with 2 other mid priced amps a little while back. Worth a read. Centurion received high marks.

Off the top of my head (I own one), output 1-1.5KW, medium noisy fan (you can hear it, but not all that bad), PS definitely built in, great QSK, seems very well made, fairly rugged.

Best of all, fantastic tech support from the guys in Sevierville, TN

: Nope.

Well -- the correct answer is always: "It depends."

One of the regional state highway patrol freqs is at 154.905 mcs.
So, I get to hear a lot of "tweep-tweep-tweep" QRM between
144.200 and 144.205 mcs.
Granted, this is not a "modification" to xmit on amateur freqs.
Oh No, it works that-a-way right out of the box.

A deep cycle marine battery should work well. I use one to power an
electric fence and they usually last about two years or more. The fence stays
on all the time. When the battery runs low, I switch it out with a second one
and put the discharged one on charge.

I'm not familiar with either model, but Yaesu and Kenwood both make
good quality radios, as does Alinco. I've never been impressed with
ICOM for VHF/UHF radios, but their portables are good. I have no
experience with Radio Shack or Standard radios.

>My interests lie in providing emergency communication during
>hurricanes, which it seems we may see more of this year.
>
I am involved in emergency communications in many aspects, and it's
quite an interesting field. It does, however, take some training and
experience to do well. It is also VERY rewarding. I do it as a hobby,
as well as my chosen profession.

>With the handie talkie, I know a simple "AA" battery pack will suffice
>for power during outages, but I'm concerned about the limited range of
>this unit (particularly considering that after a storm, most of the
>repeaters might be down).
>
I recommend having a couple back-up nicad battery packs, the highest
power available, as well as the AAA battery pack. I also have battery
isolators for my radios so that I can plug into a cigarette lighter
anywhere. I have 2 12v battery packs with gel cells that I try to keep
charged all the time. They last quite a while and are very portable.
You can even make a belt clip to carry the battery, if that's what you
want.

I don't know where you're at, but here in Phoenix, AZ, many of our
best repeaters have emergency backup power and can function for a
couple days in the event of a power outage. Check your local repeater
listing to see what has emergency backup in your area.
>On the other hand, the mobile unit would offer me better range, but I
>want to be able to use this device as a base unit, not attached to a
>car.

>
A mobile radio can be used as a base or mobile, depending on your needs. Again, the gel cells mentioned above will provide power, depending on your output. A deep-cycle RV battery will do the same. For years I had one under my desk, but finally decided to put it in the RV.

>I'm curious what some of you might be using (or have built) to use a
>mobile type radio during times of extended power outages such as a
>hurricane and what you do to recharge them (solar?).
>
I have 2 mobile dual-band radios and 2 dual-band ht's, along with the extra battery stuff I mentioned above. I've never considered solar for emergency communications, but that's not a bad idea in Arizona.

>Any and all help would be greatly appreciated on these or other
>solutions you have come up with for transmitting during periods of
>extended power outages.
>

If you truely wish to work in emergency communications, I recommend you volunteer for some public service work and get used to working in a net. It's a very structured system, and is used in the event of wide-spread emergencies. In an emergency, there is very little freelancing, so this is important.

Public Service is fun, and there are usually several events throughout the year that you can participate in. Many have a wide variety of needs, and you should do as many of the different tasks involved so as to gain experience. I feel strongly that, in an actual emergency or disaster, those who have worked public service will serve the community better in a real emergency. You can contact your local ham club, or listen to some of the local nets, to get an idea of who in your area provides public service communications. You will not be required to join a club as these folks are always seeking more help.

Hope this helps..... Ed (N7OUQ)
Dispatcher, Phoenix Fire Dept.

>Thanks.

You need some kind of heterodyne action to extract an audible signal from a CW signal. In a superhet the heterodyne action comes from the beat frequency oscillator; in a regen detector it's the detector itself oscillating; in a direct conversion receiver it's the local oscillator. A crystal set would just demodulate the unmodulated carrier and you'd only hear "psss..psssssss..psss..psss...". Crystal sets were used (e.g. the foxhole radios) to receive broadcasts, but a two-way radio of the time would have had tubes. Are you positive they were two-way sets?

73,
Mike, KK6GM

Source record: 107320

Hello. I have a Kenwood MC-60A desk mic with the built-in pre-amp for sale. The mic works 100% and cosmetically it's around a 9/10. There is moderate use on it with no problems at all. Comes with the mic, base stand, manual, and all necessary cables.

Has lock, PTT, channel/frequency up/down, and dual-impedence selector. Wired for 8 pin female connector. First $90 gets it (that includes the mic, UPS ground, and insurance). I will also trade it for a Heil Pro-Set or like mic. Thanks a lot for reading.

Message-ID: <7ihpue$4d4$1@remarQ.com>
Source record: 107323

I have both the Kachina and a FT1000MP.
The Kachina is at least the equal of the 1000mp on receive and tghe 1000mp is a highly rated unit.
TX audio is very good on the 505dsp.
It does not require a powerful computer to run.
I am very pleased with the Kachina.
If I could have only the 1000MP or the Kachina the choice would be difficult.
The Ten Tec radio does not have the features of the 505 and the Ten Tec software is not ready for prime time.
Regards Steve W8KZY

I ran across the best deal on cloning software and computer cable and adaptor combination. RT Systems has a great deal. Windows Software, computer cable and adapter for $39.00. The same cable will work with the R2 when they come out with the software for that little jewel. Their number is 1-800-723-6922. Look here for software information: http://www.rtsars.com/icq7_cloning_software.htm

Happy programing...Scott, KA7FVV

These people who are so concerned about RT Systems copywrite are probably the same people who use there FT-50's to harass people out of band and listen to cell phones, both of which are illegal. RT Systems sells the software to Yaesu, who in turn sells it to us. RT Systems will have no record of whom has bought their software. They will require a copy of the receipt. I don't see what the big deal is anyway, there's a guy in Yugoslavia who wrote a progam to program the FT-50, (to any frequency you want) and he is giving it away for free on his website.

Uh...not to quibble but, "scanners" are...uh...scanning RECIEVERS. I suppose it would be sorta feasable to boost the local oscilator power up somewhat, and sorta use it as a transmitter that way, but I don't know why you'd wanna do that.

Don't wanna sound snippy, but I think I misunderstood your question.

Thanks, people.

CIAO!

5012. Re: FT-100, Yaesu repsond to problems?

Mark,

I have an Icom 706MkII, and my sentiments are pretty much the same.
Very good for what I use it for (mostly 20 m mobile SSB). Noise blanker
does the job for me. And removable front panel is a must in my car.

Today I would likely buy the FT-100; but my 706MkII has been in the car
since the summer of 1997, and done all I want it to.

Based on the new QST review, the FT-100 sounds like a fine radio, and
I'm sure you will enjoy it. If it works for you, why listen to those
who (likley with little/no hands-on knowledge) trash it?

No, not if you mean a scanning *receiver.* You would have to add the entire transmitting section, which would be a project for someone highly skilled in radio design, and hardly worth the effort.

Of course this adapter probably works well for MANUALLY tuning a screwdriver, Gil was inquiring about an AUTOMATIC tuner for his antenna.

The original "Tennamatic" tuner origininated by Johnson, et.al., fits this bill sorta'. My problem is that it does not have sufficient dynamic range to handle 80-10M, 0-500W because the current pickup is frequency AND power sensitive.

When I last posted this observation, someone recommended an ECL phase detector (normally used for PLLs) as an alternate scheme for detecting antenna resonance. I got one of the lil' buggers, but I don't know anything about how to couple the ECL inputs to the analog RF line current and voltage. Can anyone point me to a design I can steal?

Source record: 107149

I just bought an FT-920 at Dayton. I spent a LOT of time researching the different rigs, and every brand name, too. For the money, it's my belief that the 920 is the absolute BEST on the market...(for the money). Again, I've only had it since Dayton, but the receive quality is excellent, and there are a LOT of bells and whistles on it. The DSP system is excellent, and I've had nothing but good signal reports. I know band conditions and antenna have a lot to do with it, but I've worked a good bit of DX already on 70 watts and lower. I only have a dipole in the attic (I live in an apartment), so I'm more than happy with it's abilities. I can only imagine what I could do with a tower and beam. Hope this helps, and if you have any more questions, please let me know on here, or even direct e-mail. 73's,

For Sale:

Kenwood TS-850 SAT I am the original owner and it has gotten very little use. Scores a 10 for looks. This is a 160 through 10 meter all mode radio. General coverage receive starts at 100 khz and goes to 30 mhz. I have installed additional filters for CW and and SSB making the total number of filters = 6. Very good front end. Built in Antenna Tuner. Worked all over the world with a wire antenna. In very good condition. I also have the RS232 serial port adapter to connect this rig to a computer for auto logging and control. I live in southern California if you are local and want to check it out.

Great for Field day, RTTY, DX or just SWL

$1000.00 cashiers check or money order only.

I will pay shipping conus only.

You can relpy to me at n6teb@usa.net

Thanks, and 73

<marnells@snowcrest.net> wrote:

> Anyone have an opinion on the DJ-C1T by Alinco?
> How's the battery life?

I own one of each of the three "credit card" radios from Alinco - the 2 meter, 440, and dual-bander.

I live in Southern California - and hit several repeaters witht hem with good results.

The 3.6V Li-Ion cell lasts longer than I expected. I remember using one for a 12-hour event recently (mostly monitoring) - and I was able to still use it the following day...not a scientific answer, but I believe you'll be pleased with the battery life.

You'll find folks either LOVING or HATING the fact that you need to use an earpiece with the single-band units. Personally, I use an earpiece from Otto Engineering similar to the ones used by TV news folks. Extremely comfortable...

AES has either the 2-meter or 440 unit for 69.95 in stock, as of last week, when I purchased another 2-meter one for an upcoming club raffle.

The only other minor "problem" for me is that they all scan in one mode only: "5 second resume." I would rather be able to have scanning switchable between the 5-sec resume and carrier drop...

Easy-to-program - once you do it, you'll never need the manual nor a cheat sheet.

Grab one - if you are close to repeaters and/or need to do some nearby simplex work.

- Clint Bradford, ATTENTION to Details

I got mine done the first day it was available.

I think it was well worth the $125. The DSP improvements alone
justified the expense.

I had the added good fortune of driving it there on a Friday (30 minute
drive for me) and picking it up the following Monday.

If I were going to build a simplest-possible useable tube CW transceiver I'd use a single tube crystal controlled transmitter (6AG7, 6V6, 6L6, 6CL6, 6AQ5, etc), and a dual triode regen receiver (6SN7, 12AU7, 6CG7, etc), or perhaps use a triode-pentode (6U8, 6EA8, etc). Any ARRL handbook from the '40s to late '50s should have both a single tube transmitter and a dual triode or triode-pentode regen receiver, but if you can't find any plans I can send you some.

Ya know tim, You have done nothing but bad mouth the FT-100 from the day it came out. You bitch about it but don't even own one. I would not be surprised if you don't even have a license and are one of the mindless internet trolls, who get their jollies off the news groups because they can't fit in when actually face to face with someone.

As for the FT-100. There were some problems with early models. There was a high failure rate on HF that seems to be corrected. I would suggest that anyone really wanting to know about the unit subscribe to the FT-100 forum on One list and see that the majority of folks on the list LOVE their radios. For the most part, even those who have had to send theirs back for repair are happy with the radio and the performance.

I like mine. I realize some of the limitations to be expected from such a compact size. I probably would not use mine for a fixed base station but wanted a rig to use for mobile HF. This radio fits the need and also gives me all mode vhf/uhf. So far I have not had any problems and have been very pleased. It has the best impulse noise blanker on the market. A feature that is very valuable for mobile work.

As far as "Many" people being on their third radio..... I believe there is only one.

Actually most of the discussion of so called problems comes from users getting used to the radio and learning how to use it. And that is what the forum is all about.

The "Better RF" IC-706 tune gizmo only allows your rig to xmit a 10 watt signal for "tuning purposes" and does not "tune" anything. You still have to manually move your antenna adjustment to get a match while watching your SWR meter. I think what the poster is looking for, and I also, would be an "automatic" tune control for the screwdriver antenna that would simply sense RF and move the screwdriver to the proper position for minimum SWR. Sure would be nice! Rudy, K8SWD

Lou: There are a whole bunch of active 440 repeaters here in the Kalamazoo/Grand Rapids area. For great conversations and great coverage try the N8DAN and K8IHY repeaters; for nice coverage and good rag chews try the N8GH and K8KZO repeaters. If you like cuss words, burps and other rude and crude stuff, go to the N8OKU repeater. 440 is also great on an HT and for cross band repeating through your mobile rig to distant repeaters. Rudy, K8SWD

Hi,

I trying to find if the company that made enclosures under the name York or York metal works or something similar still exists. These enclosures were commonly used in the 70's for electronic projects. I am trying to restore several pieces of equipment that uses them. They are green color, marble type texture to them, about 18x10x10 inches (although they came in many different sizes). If you could even tell me what the exact name of the company is that would be great.

thanks for any help
steve

(Pse remove "DELETE"" from my email address to reply.)

Hello All,
I'm looking for your help fixing problem with an IC-71A.
I recently bought an IC-71A and this receiver looses the whole RF from
8.0000 MHz
to 14.9999 MHz compeletely in about 30-40 minutes after power on.
It doesn't even pick up the strongest broadcasting stations.
After leaving it turned off for a few hours, it works well for another
30-40 minutes.
There's no problem with the frequency ranges below 8.0000 MHz and
15.0000 Mhz and above as long as it's turned on.
Do you have any idea?
I appreciate any advice from you. 73
Robin

Amateur Radio is indeed for a very different purpose than the Maritime Mobile Radio Service (correct term). "Marine" has no connection whatsoever with the military unit with a similar name by the way. Yes, stations in the maritime mobile radio service require licensing for the equipment and, depending on the country, require operator's certificates for the user for SOME classification of vessels (recommended that everyone using "Marine" radio equipment have at least a restricted radio operators certificate....even if not required). The reason behind it being a GOOD thing to have the operators certificate (which becomes mandatory and of higher grade for larger vessels) is that the training shows you HOW to best use your marine gear and HOW NOT to abuse the system - you'll come to appreciate this big time!). The only similarity between Amateur Radio and Marine radio services is that they both may use equipment sharing similar (not the same) frequencies and modes.

Make no mistake....Amateur Radio is a hobby....Marine (Maritime Mobile Radio Service) is serious business....whose intent is foremost to provide distress/urgency/safety services in a predictable and efficient manner....with the SECONDARY use to facilitate business related to maritime mobile operations (ships traffic, phone patches, messaging via many means). Marine radio is not for frivoulous pastime!

Don't know what the current rate is but I have seen them sold from $100.00 on up to $350.00. I would think in todays market with all the great qrp rigs available the HW-9s would be on the low in of the prices.

I live in Kansas City where all of the 70cm and 2 meter repeater pairs are pretty much spoken for. Unfortunately, being assigned and being used are two different things. Our 70cm activity is almost nonexistent and our 2 meter activity has fallen off tremendously in the last year and a half.

I was in San Diego and Los Angeles for a week last year during the ARRL Southwest Convention. I was not on the air 24 hours a day but I did not hear much of traffic out there when I did scan the bands. I scanned both 70cm and 2 meters. My ten year old daughter did have an unfortunate experience in Anaheim while visiting Disney Land. She was engaged in conversation when someone kept jamming the repeater calling some individuals "fags". While scanning other repeaters someone was jamming another repeater by playing .wav files of a women that seemed to be experiencing sexual ecstasy. After that I decided it was best to turn the radio off. I am glad we have not sunk this low in KC yet. I bet it is very difficult to find guys like that with so many people and so many square miles of city to cover.

Pay will not do it. No amount of money will ever be enough to
do what the military is asked to do. It has to come from the
heart.

What is really happening is that the Draft is on its way back.
The draft will be to the Reserves, not the active forces. The
Reserves are doing nearly 60% of the missions. When they come
home, most units will lose half of their members do to the hard
ships they face.

Besides the mothers of American sons (and daughters, wow do you
think that NOW might have real problems is we draft women?) would
prefer Reserve service as their kids can still finish college within
a normal time frame.

5066. IC-2100H Info Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-27 00:00:00 UTC
From: kk4bh@aol.comnospam
Message-ID: <19990526200213.02100.00006830@ng-ca1.aol.com>
Source record: 107210

Hi,

I just received my new IC-2100H the other day and noticed something that appears to be a little strange about it. The Volume and Squelch Controls seem to be somewhat "wobbley." The radio works perfectly fine but these controls can be "wiggled" up and down or side to side. They do hit their stops firmly and the controls don't seem to be turning in the chassis. Like to hear from other owners and see if this is common.

We are finally upgrading and selling one of my favorites. IFR1100S Service Monitor great condition, Receives from 300Khz to 999.999Mhz; Generates from 1Khz to 999.999Mhz; includes Modulation / Deviation Scope, Spectrum Analyzer, Frequency Error Meter, Sensitive (2 uv) Receiver, Calibrated Generator output from -130dbm (.075uv) to 0dbm (.21V). Other features include: Dummy Load, 3 range Wattmeter- 4,40,400 watt ranges, AM/FM/SSB modes, Narrow or Wideband Receive, Fixed 1Khz and variable tone generators, AC/DC or Battery (included) operation.

This unit also has the optional MM100E metering panel in the lid that allows SINAD and distortion measurements, AM modulation percentage, a basic multi-meter and a test amplifier/speaker and loads. A great tool when your servicing!

Included is a Motorola SLN6413A Digital Private Line encoder/decoder that permits reading and generating DPL codes through the monitor. Thumbwheels set the DPL code, but you can also plug in one of the DPL filters from early Motorola stuff to test.

Also included is a Paragon Sequential Tone Generator. This unit adds 2 tone, 5/6 tone, MTS, IMS, and DTMF encode to the package.This unit features a LED digital display of parameters and is fully adjustable for timing and frequencies. With the MM100E panel, DPL and Sequential Generators, this unit can run with many of the newest monitors.

Basic IFR 1100S' sell elsewhere on the net for $3400-3900. This includes the MM100E, the DPL and sequential units as well for only $3200 by certified funds or money order. This unit has been one of our bench monitors, and hasn't had but a few on-site trips. Cosmetically it's nice, just not mint perfect. Function wise, everything works as advertised.

In my area, anyone found using language on 2 meters is quickly smacked between and NO! is yelled at them loudly.

I got into ham radio in 1991 on a no code and promptly got my 5 wpm. When I got on the HF I found the language. Guess what? Plenty of 1X3 W calls, 1X2 and 2X2 calls have mouths that equal what you'd hear on channel 19.

Normally it's used to describe the no coders using the same language on 'their' 2 meter repeaters! Hypocrites!

I have a problem with the DX70TH and EDX2 tuner that
has all of a sudden happened.

I wonder if anyone can suggest a cause / cure.

The setup has been operating perfectly for almost 2 years.

The problem occurs when the auto tuner is activated.
The RX is not muted as normal when tuning and the
tuner only tries tuning for a brief period and then it stops.

Rig works normally ie TX / RX without tuner into a resonant antenna.

Is the tuner at fault or the logic in the DX70 that controls the tuner
???

I suspect the radio.

No output RF is mesurable from the DX70 in the tune mode !!!

Any thoughts ??

Direct email welcome gilly@camtech.net.au

I'd agreed. Whenever I drive down to Southern CA, which is not as
often as I spend time in Pacific NW, I don't really hear alot of
traffic. According to one I heard on local 2m repeater, the 440
repeaters there are mostly privately owned, and not generally open
to the public.

----------------snipped-----------------------------
My ten year old daughter did have an unfortunate
>experience in Anaheim while visiting Disney Land. She was engaged in
>conversation when someone kept jamming the repeater calling some individuals
>"fags". While scanning other repeaters someone was jamming another repeater
>by playing .wav files of a women that seemed to be experiencing sexual
>ecstasy. After that I decided it was best to turn the radio off. I am glad
>we have not sunk this low in KC yet. I bet it is very difficult to find guys
>like that with so many people and so many square miles of city to cover.

I don't hear alot of that in the Pacific NW,people tend to be very
polite and civil up there, but I do hear behaviors like that in SF
Bay Area. That kind of stuff kind of make me think
twice about weather if I really want any children getting involved
in this hobby. Even in SF Bay Area/Si Valley, the traffic on 440
repeaters is virtually nil.

Cliff pointed out earlier that all 440 repeater frequencies are
allocated. But allocation does not mean it's being used. Why not
review and renew the frequency allocation every few years and remove
those private repeaters that just take up unused frequencies?

Try the hardware store in the heating products area. We use aluminum
tape for sealing and shielding splices on phone cables. It's generally
not hard to find. Comes in several different widths.

I just purchased an FT-100 about a week ago. Unfortunately, due to my rather busy schedule right now, I haven't had the chance to get it fully installed and play with it yet. I have gotten the VHF/UHF working (as far as the antenna is concerned) and I'm working on the HF part. I just did the only mod I can find for the radio and was curious to find that it opens up the TX on every band BUT the 6 meter band. Is there another mod out there that opens this up too?

Source record: 107060

Joe, neither of these radios will do dual inband recieve vhf/vhf, uhf/uhf, if that is important to you. The VX-5R has had a lot of problems in the scanning mode with detecting DCS tones. I think the last production run was supposed to have fixed that bug but I havent tried it yet.
I think the best buy for the money in an HT at this time is the W32A Icom, good loud audio, and will recieve 800meg band and will do dual inband recieve and you can monitor 2 seperate bands at the same time. you cant with the others.
73
Have not had any experience with the 50R.

5114. What HAM equipment

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-28 00:00:00 UTC
From: GS Esterhuizen <nessus@diac.com>
Message-ID: <XQB33.276$Ap3.463@newsfeed.slurp.net>
Source record: 107063
Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment

Lo there.

I think the HAM Radio bug just bit me, the problem is that i'm finding it a bit dificult to decide what equipment to buy. I have just read the book "All about HAM Radio" by Harry Helms (hey, i have to start somewhere!)

I have got a LOT of questions, so please if you have the time hear me out.

I just moved to Denver, CO. With my parents (yah, i am 17) from South Africa, so we live just next to the mountains in a valley, called Ken Caryl Valley. Dont know if that would be a problem with radio communication.

In his book, he sugested for beginners to buy a Hand Held radio, now i have looked at Kenwood, Yaesu and Icom. In tht book they said that your hand held should be able to recieve the 2m band. Because i am quite interested in satellite communications I suppose I should have to get a dual band radio that supports 2m and 70cm. The problem is, i don't know what kind of output power you need to use satellites for communication. I have seen alot of hand helds that can do 0.5W and then some that can do 5W. I am also gonna be in the Rockey mountains camping out and enjoying all the air :), what i would like to be able to do is to be able to report back home etc. Do you need a 0.5W or 5W for that?

For now, my budget it about $500. The other big reason that got me interested in HAM is the ability to connect your Radio to your PC with a TNC(?) i suppose. I run linux on my PC, and would really like to be able to connect to another PC with my Radio. What equipment do i need to do that, i have read that you need JUST a TNC and then in other placed on the NET i see that you need a TNC and another card you plug in your PC? I would like to be able to use 19200 baud or faster. What equipment do i need?

(hmm, this is getting quite long but thanx for reading to here!)

I have seen a radio, the TH-D7A from Kenwood, it got a built in TNC, does that mean that i can just plug that into my computer without additional hardware? or do i need a PC card in my computer? This APRS, is it JUST a way of seeing where other blokes are with GPS equipment? Is it possible to surf the Internet through your Radio? or just to send Email? Unluckily the TNC is only 9600 baud. Would it be better to buy the TNC seperate? For when i buy a big Transciever the transciever can just plug into the TNC?

Then later(when i have made some money), after i have bought the HandHeld and equipment to link it with the PC, I would like to buy a transciever that can do HF. Any good ones you know of that would not blow a hole in my budget?

Thanks.

Stephan Esterhuizen

Jeff:

It's really not to difficult to accomplish what you desired in your post. The answer is, certainly, yes. You need to pull out of the scanner all the proper LOs (local oscillators), mix them in the proper order (using doubly balanced mixers), and modulate the final result with the type of modulation and information you desire. You're there! You may prefer to apply a little amplification to the result to render the "signal" a bit stronger, but that isn't too difficult, either, in these days of MMICs and hybrids. Trivial!

Dave - W6LEV

For Sale:

Kenwood TS-850 SAT I am the original owner and it has gotten very little use. Scores a 10 for looks. This is a 160 through 10 meter all mode radio. General coverage receive starts at 100 khz and goes to 30 mhz. I have installed additional filters for CW and and SSB making the total number of filters = 6. Very good front end. Built in Antenna Tuner. Worked all over the world with a wire antenna. in very good condition. I also have the RS232 serial port adapter to connect this rig to a computer for auto logging and control. I live in southern California if you are local and want to check it out. Late edition serial number #60800xx

Great for Field day, RTTY, DX or just SWL

$1000.00 cashiers check or money order only.

I will pay shipping conus only.

You can relpy to me at n6teb@usa.net

Thanks, and 73

Dave N6TEB

Ok; thanks for the clarification. It's very likely that it was just the mic which produced the bad sound I heard. And I think that radio was passed between a few people, thus why so many people sounded awful! <grin>

Maybe I'll give it a second thought...

DR-605T

THIS IS ANOTHER NEWBIE ? PLEASE FORGIVE ME!!!

I am currently in the process of looking for a good mobile radio for use with satellites. Can anyone tell me if this radio can handle alot of use, is it a good radio, and does it work well for satellites?

Also, what kind of seperate power supply would I need to run let say a mobile radio and what kind of power supply would I need to run one of the big base station radios?

Thanks! Please reply to tlslide@midwest.net or right here in this newsgroup.

Thanks David!!!!

How about a 1-tube (or transistor) regen receiver, with a telegraph key to throw it into full oscillation for transmit? Essentially, on transmit it'd be an Armstrong oscillator. Would have terrible frequency stability and probably a lousy chirp, but it'd be very minimal in parts and if you kept the power very low no one else would hear it to complain :-)

Curious - Does the CI-V interface allow me to query SWR? If so, could I use this interface, and a some microprocessor (a Stamp?) to simply query SWR from the 706 directly? Then use that value to control the motor drive of the antenna? Mind you, always skip the stamp project pages of Nuts & Volts, so I'm definitely guessing here! Sound possible?

Harry,

Couldn't help but notice your post. You do not need the interface that Jack has in order to safely key the 2KL. The 706 will only switch 20ma so you have to have the interface for most tube amps that are 100ma or above. I run the IC-706MKII DSP with the IC-2KL myself. What you need is the Icom accessory cable OPC-599 and the OPC-118. Those two will allow you to connect up to the 24 pin molex connector on the control cable furnished with the 2KL.

73,
Van W0NZV

At a hamfest last year K06YD Designs (the 706 auto-shift guy) was
working on a memory tuner for screwdriver antennas. Although it
wouldn't autotune with band changes, it had memory presets for each
band rather than the current method of manually tuning with a switch.
I don't know if he ever perfected it.

Source record: 107096

Hello,
does anybody know about the Serial-Data-Format used with ICOMs
IC-PCR100?
Maybe ICOM again is using the CI-V-Format like with other radios (
Manual for this already is available).
The idea behind this is, to construct a simple
One-Chip-Microcontroller-System that could control the PCR-100 for
specific channels/frequencies without needing a PC.

> http://www.rtsars.com/icq7_cloning_software.htm
>
> Happy programing...Scott, KA7FVV

You can also donwnload my (free) Software for the IC-Q7
and IC-R2, you will find some things not implemented in
the competition products like adjustment mode, entering
frequences below 30MHz ...

You can also make the cable for 2 US$, that will work
with the IC-Q7 and IC-R2.

For 50 US$ you can get a interface that will:

1. program/control every radio Half and Full duplex.
2. program any eprom, seriell and parallel
3. communicate with every GSM phone, Nokia, Ericsson, ..
4. communicate with any calculator/organizer
5. read/write any Smartcard, GSM, I2C, Phonecards, ...
6. emulate any SmartCard.
7. connect temerature sensors
8. MagstripeCardReaders

any a lot more

That is the best deal.

5159. Need Info/Manual Kenwood TR7850

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-29 00:00:00 UTC
From: chaconne@idsonline.com
Message-ID: <374f6a1e.5405361@news.idsonline.com>
Source record: 107100

I am looking over a TR7850 lent to me by a worker at my marina who bought the 2 meter FM at a yard sale. As he is unlicensed, he saw my ham tags and asked me to check it out to see if it works. I think I have it partially working, but first a few observations.

1. Good news, I am able to xmit/recv and hit a repeater 30 miles away with a very makeshift antenna.

2. It appears that the only way to enter a freq is through the key pad or scrolling up/down from the mike. At present, the main tuning knob only scrolls through channels 0-14 which must be preprogrammed. Am I on the right track????

3. The keypad on the back of the mike do not seem to have anything to do with entering data. This leads to last question.

4. Does anyone have a operators and/or service manual. This would likely help in identifying what the units capabilities are and what I should be doing. Once I figured out a few things it seems to be an OK rig. Pricing for copy/mail???

Please post AND email to me. My ISP leave something to be desired for

newsgroup postings.

Greetings from Tornado Alley.

The service panel at my house has a GFCI breaker built right into it for the 120V, 15 amp circuit that covers the garage, bathroom, and outdoor outlets. It is full of RFI! It puts out strong, wideband interference on 114kHz, and similar noise all over the LW, MW, and SW bands as well.

Anyone have a similar experience with CGFI's? Anyone know of a good RFI-free replacement for my service panel?

Fred:

I am not familiar with RFI-generating breakers, but an alternative might be to replace the GFI-breaker with a standard breaker, and then install a GFI-outlet as the first outlet in the string -- thus providing comparable GFI protection to all the outlets on the leg.

I have in very good condition a Sailor Receiver Type R-1119
Sailor Exciter Type S-1303
and 500 watt Amplifier/220V Power supply Type T-1130
These are all rack mount units in great condition and operational when taken out of a cruise ship about a month ago. I have a complete set of manuals with all the technical manuals included. They will require interconnecting wires as they stayed with the rack. All are fully solid state. The exciter has been updated with the new ITU frequencies. The Amplifier/powersupply can be used seperately as a 500 watt output linear amplifier. I have photos upon request. They require 220VAC and would make a very good amateur station. If you need to ask any questions I can give you an address of a fellow ham who is using the very same system and finds it most impressive. The company Sailor is the leading manufacturer of high end communications equipment and also the first global telecommunication network called Iridium. $900+shipping for all three pieces. Or Trade for KWM2,75A4 or 2KW HF or VHF Amplifiers

Mike,

Here's the page to let you select form 610 for download or to load to your Acrobat reader to print out.

http://www.fcc.gov/formpage.html

And here's the address of the actual page with the 610 form. You'll need Acrobat reader, available for free download and install.

http://www.fcc.gov/Forms/Form610/610.pdf

I think you still have to fill out the form and send it in. They're very quick about getting the new license back to you. I think it took me less than 2 weeks, just prior to Christmanstime last year.

You need to file a new form 610 by mail, with your new address on
it, as a request for a modification of your license.

But you can at least download the latest printable version of form
610 from somewhere on the fcc.gov site, I forget exactly where,
which speeds things up quite a bit.

All the best,

Kevin, WB4AIO.

There are a few books out there with some information on the WW-2 era radios used by the OSS, SOE, and other Resistance Groups. There are three by H. Keith Melton entitled:

CIA Special Weapons and Equipment

OSS Special Weapons and Equipment

Clandestine Warfare

These books have all sorts of gear - not just radios. The information on the radios tends to be photographic and some capabilities information. For the most part, no schematics.

There is another book by Pierre Lorain
(which was adapted in U.S. by David Kahn) called:

Secret Warfare

This one has some more detailed info on the radios and how they were used and includes some schematics.

A later poster notes that many of the radios were quite simple and probably similar to something one might find in an ARRL handbook between the years 1940-1950, or the RSGB equivalent. This appears to be an accurate observation. There is one radio noted called the "Paraset" which is a 6V6 transmitter and a Regen Receiver using two 6SK7s. Of course, (as we Old Timers know) the Regen Receiver may have transmitted as well as the transmitter. In fact, the enemy DF crews could probably track down a receiver almost as easily as the transmitter.

Most recently (mostly last half of 1995, I think) there were "nostalgia"
articles by Dave Ingram K4TWJ in "CQ Magazine" and the September 1995
issue had plans for a very simple tube transmitter and receiver using
battery operated tubes.

For something a little more "vintage" find a September 1960 copy of
Electronics Illustrated. It has a classic transceiver which uses a 6V6
transmitter, 6U8 Regen/Audio Receiver, and a 5Y3 Power Supply. It is
very similar in concept and construction to some of the OSS/SOE rigs
shown in the books I mentioned in my previous post.

I got it as a gift and I already have one. I never took the radio out of the box.
The radio also comes with a brand new Diamond srh-519 sma antenna which costs $35 and a Maha MH-C204F rapid charger for AAA or AA nicads/nmhd batterys. The cost of this plus 4 nmhd AA cells was $30. I am asking $200 for the whole package. Remember this radio is brand new and was never used. I will pay shipping, if interested please email me.

Thanks

Tony

Does the rapid charger (or the internal charging circuit, for that matter) stop charging when the green light (or charged message) comes on? I would like to know if I can leave a battery in overnight, or whether I have to remove it as soon as the charge indicator is on.

Thanks in advance

From: Ron LaPedis <Ron@newsguy.com>
Message-ID: <7ipgac$1els@drn.newsguy.com>
Source record: 107127

Please reply to ronl@laserphernalia.com - Thanks!

I have a brand new VX-1 with A106 firmware and bought a copy of RT Systems ADMS 1E software. I want to modify my radio for MARS/CAP xmit because the company I work for has a business license within the VHF-H band and I may be able to get away with not carrying a company radio if I have mine.

I made the memory change with Template Modifier, loaded it to the radio and read it back. It looks correct, but still no MARS/CAP. I tried using EVE both with native and VER050 comm protocols and always got corrupted data from the radio, so this won't work. I even tried reading the .RDF file that ADMS created, but EVE didn't like it. (BTW, the URL I am using for all my info is http://www.icongrp.com/~sllewd/vx1rmain.htm)

help!!

Thanks,
Ron LaPedis

FWIW...

Many inspection authorities will gag at the installation of a breaker
not listed for the specific panel in question. Even if the breaker will
fit and function properly, unless the panel listing includes that
specific breaker, you can be required to replace it with a listed
breaker.

Hi, Some time ago, I recall seeing a posting here about how to extend the receive frequency range of a Yaesu FRG-9600 receiver. This was some variety of CPU diode/jumper mod that would extend the tuning(programming) range from about 40 MHz(or lower) to over 935 MHz. If anyone has this info would you be so kind as to pass it along. Ive looked over at the QRZ and Oakland mod lists and they have nothing there. Many thanks Steve DE WA1YKL

QST magazine had an article about bike antennas in the march 193 issue. Using one design, I made one for my bike using an old CB antenna with a 52" steel whip. I clipped the coils wires and re-soldered the coil connections using a wire of minimal length. The SWR is under 2. I attached it to the luggage rack on my bike and used a 1/ wave counter poise. I can hit some repeaters up to 20 miles away.

A better antenna is a TV twin lead-in wire J-pole that I made for use in my house. There are some plans floating around on the internet and you couple find them via Yahoo or Dejanews. For bike use, I slide the J-POLE into about 5 feet of 1 inch PVC and secured the top of the JPOLE with a PVC cap over the pipe. I then use an S ring and put one end (downward opening) of the S ring over the bike's rear frame at the left side of the rear axle. I then set the bottom of the PVC pipe onto the other end of the S ring. I use a bunge cords to hold the PVC pipe straight up.

I have worked two public service events with the JPOLE and am happy with it. It is the better of the two antennas. Unsure of max power on the JPOLE, but the first antenna above should be able to handle your wattage.

Let me know if someone e-mails you a better design.

Greg:
You are talking about a half wave antenna. Larsen sells these and
they recommend them for sailboats with fiberglass decks, back-hoes
and other heavy equipment, and yes bicycles too. Some of the other
companies make them as well, such as antenex. You will almost get
the same gain with a half wave with no ground plane, as you will with
a 5/8 wave with a ground plane. You will get at least 2dbi gain over
a quarter wave with ground plane. You will not be disappointed.
Good luck and 73,
--

FOR SALE:

Kenwood TS 520
Kenwood VFO 520

Both are in immaculate condition, I'm the original owner.
Condition is ~9.9/10 outside and inside (just inspected inside -
absolutely without dust).
Many extras make this a perfect starter or step-up package:

* ALL boxes (each with 2 sturdy boxes) and packing included.
* All original manuals.
* TS 520 Service Manual included (RARE! - this fetched $28 on e-bay 5/26/99).
* All original cables as well, plus height-adjust feet for each.
* Turner amplified microphone included.
* Many other accessories thrown in - call or e-mail for details.
* Pictures available.

Asking $299/o.b.o., buyer to pay shipping

Well, I take mine with me on service trips to repeater sites and it does better that most walkies. If there are signal mixes that present a signal on the frequency your radio is tuned to, you are going to hear it! The best cure for this and the high power pagers is to run tone squelch.

Can anyone comment to me as to how the VX5 performs on Broadcast Band ?
Does it pick up signals just using the antenna as supplied?

The thought of a unit that gets the Ballgame and Newsradio intrigues me.

But hooking it up to my longwire defeats the purpose of shirt pocket
portability...

Any comments appreciated

Tks

5232. HBR reflector now available

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-30 00:00:00 UTC
From: robertc908@aol.com
Message-ID: <19990530113918.10853.00005363@ngol04.aol.com>
Source record: 107009

For those of you that are interested in HBR receiver the reflector service at qth.net is now available. To subscribe just send a note to majordomo@qth.net and in the body of the text just say subscribe HBR. You will receive a confirmation message with addtional instructions. Just follow the instructions and your all signed up and will receive messages from the reflector just like Hallicrafters, Hammarlund, etc.
Below is a brief description of this group.

Do you remember the HBR receivers that were designed by the late Ted Crosby, W6TC? There were several versions of these very popular homebrew receivers. The first was the HBR-14 published in the July 1957 QST, followed by the HBR-16 in the October 1959 QST, the HBR-8/11 in March/April 1963, the HBR-12 in April 1964, and the HBR-13 in the October 1965 QST. There were also many improvements and add-ons by others, Alexander Stewart, WA4ZNI and William McKay, W7QBR to name just a few.

Many HBRs were built, and there is presently a small group HBR enthusiasts who are interested in your stories about the HBR you anticipated building, built,
used, or currently use. We would like to know your perception of how well it performed, problems you had with construction, calibration, etc. We're also interested in hearing from those of you curently trying to locate an HBR or if you anticipate building one.

We would like to hear about any correspondence that you may have had with Mr. Crosby, Mr. Stewart or the authors of HBR related articles published in QST and other amateur publications. Also, don't forget Mr. Ed Kent, K8EML, he was the compiler of the original HBR Notes. Did you have any correspondence with him? Tell us about it!

If you are currently interested in building one of these fine receivers we invite you to network with us. There are no fees, we're just a group of HBR enthusiast that help each other locate and obtain the necessary parts, share construction hints, etc.

In summary, if you're an admirer of the HBR tube receivers, then we would like to hear from you.

73's
Bob, W4RLC (formerly WA7OGU)

All:
In an effort to raise cash for the new Kenwood HT with built in packet, I have decided I need to sell my notebook computer. The computer has only been used as a secondary machine in a home environment. It has a large 11.5" diagonal Active matrix screen. It also has a built in CDROM drive with small external floppy.

Everything is working "as new".

I am asking $480.00 or very close offer. If anyone has a Kenwood TH-D7A they wish to trade, that would be good too.

Hi There and thanks for reading.

My IC-900 crapped out and Icom doesn't want to fix it.

Please sell me an IC-901. Email with details.

Thanks,

DC (KC6VHG)

Needed a throw-down two meter mobile and bought the Radio Shack HTX-242. I'm very happy with it. However, I'm very curious as to who builds it for Tandy. It has a reputation for having a very good front-end that really rejects intermod. Solid radio. I had no intention of buying a RadShack radio until, to my surprised, my friends receommended it.

Anyone have an idea? Please email directly.

Don't normally do this, but that price is a little steep. You can by a
brand new one for less than $1400.00 and it will have a years warranty.
By the way, the warranties are not transferable

5248. Display lamps ICOM IC-28A

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-30 00:00:00 UTC
From: Fred <ke8tq@qsl.net>
Message-ID: <Ueh43.7$_q.193@news.megsinet.net>
Source record: 107025

Anybody know what the number of lamp or bulb is used in the ICOM IC-28 series radios. Both of the lamps in mine have finally burned out, but then it is around 15 years old so I can't complain.

I looked for them, but it is so packed in there in the front part of the rig that I didn't see them to get a good ID on them.

Any ifo will be appreciated.

I have in very good condition a Sailor Receiver Type R-1119
Sailor Exciter Type S-1303
and 500 watt Amplifier/220V Power supply Type T-1130
These are all rack mount units in great condition and operational when taken out of a cruise ship about a month ago. I have a complete set of manuals with all the technical manuals included. They will require interconnecting wires as they stayed with the rack. All are fully solid state. The exciter has been updated with the new ITU frequencies. The Amplifier/powersupply can be used seperately as a 500 watt output linear amplifier. I have photos upon request. They require 220VAC and would make a very good amateur station. If you need to ask any questions I can give you an address of a fellow ham who is using the very same system and finds it most impressive. The company Sailor is the leading manufacturer of high end communications equipment and also the first global telecommunication network called Iridium. $900+shipping for all three pieces. Or Trade for KWM2,75A4 or 2KW HF or VHF Amplifiers

Dunno about six meters but I bought a ten meter module for my 741 when AES had a sale on them and had so mani RFI problems I sent it back. The radio was remote mounted in a Ford F150 truck to a glass mounted antenna. I could run 100w. with the TS680 and Hustler mounted at the rear with no problem. Putting my hand over the LCD reduced RFI a great deal but no amount of grounding helped.

Source record: 106838

The Kenwood 7850 is a 50-watt (input) 2-meter rig designed for mobile use. It has a DTMF pad on the front panel, scanning buttons on the microphone. It's functionally identical to the 7800 except for the power input (the 7800 was as I recall a 10-watt unit, but I could be wrong there). I've had one for about 15 years, and it continues to give good service.

5262. IC-T81A vs. VX-5R

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-31 00:00:00 UTC
From: Wayne Rash <wrash@mindspring.com>
Message-ID: <7iueuf$n0s$1@nntp1.atl.mindspring.net>
Source record: 106839

I'm trying to get some idea of the relative merits of the Icom IC-81A, which is their new 4-band HT, and the Yaesu VX-5A, which is the 3-bander that's been out for a few months. Any experience out there on the 81A? Anyone who has seen both and has an opinion?

I've decided to upgrade the old FT-208R, and figured I might as well try a multi-band solution. I realize that I'm kind of rushing things since the FT-208R is only 18 years old or so, but I don't want the tax refund to go entirely to waste.

I'd be delighted to hear your thoughts.

The above mentioned packet controller, has both 1200 and 9600 baud modems.
Asking $150.00 as I am not sure what the value of these are at this time. I
will take any reasonable offers.
Thanks

It is up/down volume, up/down band, and if you successfully push straight in, access to CTCSS/DUPLEX/Menus. Difficulty for me is getting the straight-in push without inadvertently actuating the band/volume or some other unexpected action.

From: steve <steve@g4uol.demon.co.uk>
Message-ID: <59RDwOAscwU3EwAH@g4uol.demon.co.uk>
Source record: 106851

Hi There

A friend of mine is having a problem with his Emotator control box. We are unsure of the exact model, but it has a circular dial, three four inches across, 7 round pin's on rotator, takes 7 cables. The front of the box has four led's in a vertical line. On the box all it says are the words Solid State. It has 5 ic's and three enclosed relays on the circuit board. The box casing is black,

He urgently needs a copy of the circuit diagram for it, as, although it works okay, turning the rotator, is not showing which direction the antenna is pointing! It works fine on a three foot piece of wire, but not a long length.

Have you heard of the company ? Maybe you could send me the full name of the company and I could email them direct or do you know the model and can help with the circuit diagram? Any assistance would be gratefully received.

Please email me direct, or via the newsgroups.

Note: I have also tried several other newsgroups due to the urgency of the situation. All works other than the control box, after weeks of antenna work :(

If it's unlicensed, fairly-reliable comms up to 1/2-to-3/4 mile that you need, then FRS might be for you.

The best of the current crop are the Kenwood and the Vertex, in my opinion. I have purchased and tested many available models. If it is sheer ease of use you desire, then the Vertex cannot be out-performed. If it's full-featured bells and whistles you want - you'll appreciate the Kenwood HT.

What do you need as far as this type of communications are concerned? A family outing at a amusement park? Camping trip? Kids around the neighborhood? If I knew what your comms requirements were, I could better advise you!

HELP!

I am acquiring a Motorola Syntor and need a list of
frequencies to ask the seller to program into it.

We are moving to West Pasco County in Florida,
likely the New Port Richey/Hudson area.

I am interested in helping with emergency communications
and in local repeaters where there is good traffic info,
on-air swap nets, and good regional coverage for
conversations when in the car.

I need this information asap and would appreciate any
direct info or referrals to reliable sources. (I have E-mailed
emergency response Ham folks in the region and the
silence has been deafening.)

Thanks! & 73,
~~~

Source record: 106855

I have a small article about FRS radios below. You may have access to alt.radio.familyradio or something like that, but there is a lot of misinformation there also.

Richard
KA0DXM

FAMILY BAND RADIOS

A 1996 change in FCC regulations in the United States has created a new radio service, the Family Radio Service, FRS. These are UHF walkie-talkies, about half a watt output, with up to 14 channels. The most heavily promoted radios are the Motorola talkabout radios. I use a Midland 75-510, around $100, all the features including rechargeable batteries and a lock button to prevent inadvertent frequency changes, which I consider important. (www.aesham.com is where I usually buy radios, and have for 20 years.)

Prices vary from $50 to $150 per radio. I consider the single frequency radios without CTSS (quiet codes) kind of useless, as you will hear all the other traffic on the channel, and it will drive you crazy, unless you are in the middle of nowhere. (I expected that this would happen, and a friend told me that this did happen to them skiing at a large Colorado ski area). The quiet codes do not prevent interference or prevent other people from hearing you, but they do generally prevent you from hearing other conversations on the channel. This allows you to leave them on, turned up loud, so you will hear your group and no one else. Most radios support an industry standard set of 38 CTSS tones. (My Midland radio lists tone 1 as 67 Hz, and tone 38 as 250.3 Hz). Speaker-microphones are available for most radios, some have headsets with voice-operated transmission (VOX) for maximum convenience.

I figure a range of one or two miles, (2-3km) depending on terrain, for most use. For range, hold the radio in front of your face, not next to your body, where you lose a lot of signal due to the proximity of your body. I use mine mostly for skiing with family members, where I can keep in contact with different groups scattered around the ski area. If you use them for skiing you will need a harness or lanyard or some way to avoid dropping them and losing them. From high on the mountain, range is very good.

FRS Limitations: Since FRS radios, by regulation, cannot connect to external antennas, they have a very limited range from inside a metal vehicle. An external antenna would enhance range from inside buildings or other locations as well. Not useful for emergency help,

since most users use the privacy feature, so they probably will not hear you even if you can hear them.

ALTERNATIVES TO FRS:

Ham Radio 2 meters works very well, but requires a test and license for each operator. Walkie-talkie direct range is a little better than FRS. With external antennas and more powerful radios 10 to 20 miles is typical. Repeaters allow greatly enhanced range, 30 to even 100 miles. Good for emergency help. It's really a hobby, not a convenience service.

Cell phones: Pay by the minute, plus so much per month. Coverage area varies, and some of the digital services do not have good coverage outside of cities. Not convenient for more than two sites, so not good for a group spread out in three or more places. Can make phone calls to anywhere on the globe, so range often unlimited. Good for emergency help, but realize than 911 may connect you to an emergency center far away, which will need to reroute your call to the correct agency.

Citizen band, 27 MHz: Good range car to car with good antennas, 5 to 10 miles. Interference from skip can be a problem, especially during the higher part of the sunspot cycle (1998-2001). Limited range as a walkie-talkie due to antenna limitation. Can probably get emergency help on Channel 9, 19, or another busy channel.

GMRS band, UHF: FCC license required, allows higher power (up to 20 W or so). In addition to walkie-talkies they allow external antennas, mobiles, base stations and repeaters for increased range. This is like FRS, only better, but radios are more expensive. I have not used this service, but understand it to be quite effective. Some people may be able to use VHF or UHF business band radios.

49 MHz walkie-talkies: toys, very low power, very limited range, sometimes not further than you can yell. Forget them for any real use.

GENERAL NOTES FOR ALL SERVICES

Note that in large cities most of these services, with the exception of cell phones and amateur radio (usually), are like to suffer interference from other users and powerful radios of other services.

Range will vary with terrain, nearby metal, the antenna, and other variables too numerous to recount. To get any significant range, you will probably need to be more or less line of sight, especially on UHF. Sometimes moving a foot will make a big difference.

Note that different countries have different regulations with respect to radio. I believe that Mexico and Canada permit CB.

For more info on US FCC regulations of FRS and other services, try http://www.fcc.gov/wtb/prs/Welcome.html

I have no financial connection to any radio service or business. I have been an active ham radio operator for 20 years, and was first licensed in 1962.

>

It does ok if you're close to the stations and not way out in the boonies, otherwise, it's pretty deaf on the AM and SW bands with just the stock rubber duck. You can unscrew the top portion of the antenna and clip on a wire and it does a respectable job. On the FM broadcast band, it does fantastic with the duck.

Joe, I use UHF almost exclusively while mobile. True there are far
fewer folks using UHF, but there are also far fewer conversations about
how people are going to learn the code, are trying to learn the code, or
cannot learn the code. Silence is preferable to that, and it is a
refreshing change of pace.

Hi Everyone,

I am going to get the Yaesu VX-5, and I have a (theoretical) question about the antenna SWR. The HT will operate on the 440 band, but what would happen if someone who didn't know any better accidentally keyed up (on one that was modified to do so) on , say, 462.7125? Would it :
A.Transmit with full power and potentially damage the unit from reflected RF
B. Automatically reduce/limit the TX power to a safe level so that any reflected RF would not damage the unit
C. Not transmit at all.

Any help will be appreciated. The one I am going to get has been modified, and I want to ensure that I do not accidentally damage the unit while learning to use it. Thanks.

It would transmit just fine. I would choose answer B. myself. It wouldn't be like you were trying to work weak signal or moon bounce or something that required every db of signal that you could muster.

You will find that most stock antennas are/were resonant outside of the amateur bands anyway.

73 de,
Jim, WK1V

P.S. I am not an engineer but I'm sure there is one or two or three in here who will tell you precisely what will happen. I am not a know-it-all but I do have experience working with an Alinco DJ-580 since 1992 with a non-resonant UHF antenna and it's been working fine....and is still working fine. The antenna on my FT-530 is not resonant in the 440 band but it works just fine.

5297. Motorized Mobile Antenna Mount.

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-31 00:00:00 UTC
From: David Rich <kg0usREMOVE@swbell.net>
Message-ID: <3752186F.DCC5FD04@swbell.net>
Source record: 106964

Does anyone know of a company that makes a small motorized antenna mount that will allow an HF mobile antenna to be placed in the vertical position during use and rotate the antenna so that it is horizontal and close to the roof when not in use? I have a Suburban and it barely clears my garage door. I would like to mount a HF antenna such as the ATLAS 100 with a motorized mount to do as I described above. I would like for the whole thing to fit under the luggage rails when in the horizontal position.

It would be great to build a detector that would automatically detect the DC sent down the coax to the Atlas and then raise the antenna. On the absence of the signal it might be possible to have the antenna go to the horizontal position.

I thing Diamond makes a motorized mount but it looks like it might protrude above the luggage rails to far. Someone suggested that some Marine applications require this kind of motorized antenna mount. Does anyone out there know of any other company?

Thank You,

Dave KG0US

5298. FS STANDARD c568A mint condition reduced $280.00 shipped

The price of the standard c568A triband HT has been rudeced to $280.00
it is as follows

I have for sale a standard c568A in mind condition 2/440/1.2ghz.
comes with 3 antennas
includes diamond rh-519 stock and other dual band antenna
stock battery pack with drop-in charger fast or trickle your choice
200 memory channel chip.
AA case. for regular batteries
with 6 nickle metal Hidried batteries
Maha speaker mic
amp and a half power suply
has been fully moded..
complete price $280.00 shipped.
reply via E-mail direct if interested.

As with most any mike, it's pretty easy to figure out if you have a VOM / continuity meter, but generally the white wire is the mike "hot", shield is ground, and the rest are switching...

I took mine on a trip tp Baltimore. Stayed downtown near the
inner-harbor, lot's of high band stuff there. Two meters was usless
because of the intermod. Didn't seem to bother 440, didn't try 6.
Sure made me glad I live way out here in the "sticks".

5302. multi-band amps

Newsgroup: rec.radio.amateur.equipment
Date: 1999-05-31 00:00:00 UTC
From: wizard@eskimo.com
Message-ID: <37525066.550739186@eskinews.eskimo.com>
Source record: 106969

I have the following items for sale......

Henry S-80 2M mobile amp, 80W out / 5W in - $50

Homebrew 80-6M base amp, 1.5KW out / 100W in, VSWR; Temp; Overcurrent protection, Thermaly switched cooling, Digital power display, Seperate amp and power supply decks. Requires 220VAC. Uses 8 MRF151G dual power MOSFET's. More info at -http://www.eskimo.com/~wizard- only $1800

10KHz-230MHz lab amplifier. Wideband MOSFET amplifier. It delivers a minimum output of 35 watts throughout its range. 1 milliwatt input required for full output. This class AB (all mode) linear amp includes F/R power metering, built in power supply, thermal protection, 100% duty cycle operation, ALC and RFG control, VSWR and overdrive protection, Temp protection, and remote control capability. Has computer generated data. Setup for 120VAC. $1200

RF power labs 0.5-250MHz amplifier. 5W 37dB gain, built in power supply, watt meter, temp protection. Has computer generated data. Similar to Kalmus engineering model 505C. Setup for 120VAC. $350

More info for these amps at -http://www.eskimo.com/~wizard/labamps-

Power transformers, 100A, provides 16V and 32V taps with 120/240V input. Still in box. Full data provided. May be paralleled for higher current. Unit weighs 45 lbs. $85 plus shipping from 98012 zip.

I have Version 8 and have been asking for some of the things in 9 ever since
I got it. I looked at the ad and am singularly unimpressed. It is still a
dos program and still has no variable length or user configurable fields.

My opinion is

For contest use NOTHING beats Troll
For General Logging NOTHING beats Logic 5.

For me, that is what I will stick with.

Greg, there's supposed to be a Bicycle Hams organization - I think they
even had a forum at the Dayton Hamvention. Rather than re-invent, why
not try to contact them? I'm sure they've found what works.

Hello. I'm interested in buying a Heil PRO-Set headset/microphone. It must work 100% and be at least 70% cosmetically, and I would prefer it to come with either a HC-4 or HC-5 and adapter cables for Kenwood. Anything other then that is extra. Let me know if you have one for sale. Thanks a lot for reading.

5318. IC-706MKII Squelch ?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: tacitblue@iname.com
Message-ID: <99060118301503.28543@weba6.iname.net>
Source record: 106735

Hello,

Thanks for stopping to read this.

Does the 706MKII have squelch ability on SSB ? I can't seem to find the command in the book and right now it's acting as an RF Gain, except on FM.

Will it do the squelch on SSB and FM at once ?

5319. ++++FS or TRADE:2 UHF Saber 1's and 1 UHF Saber 1E++++

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: hq54@aol.com
Message-ID: <19990601185714.15309.00001420@ngol02.aol.com>
Source record: 106736

HI All,

I have 2 Saber 1's, 12 channels, in very good condition, and 1 UHF Saber 1E 24 channels or 12 with RPT and DIR capabilities, for sale. I have various splits available, let me know what you want. Saber 1's I am looking for $250.00, and the 1E I am looking for $325.00, all are best offer. All radios come with High Cap battery and Antenna. Please E-Mail if interested.

Thanx
Mike

5320. ++++WTT or WTB:LOW SPLIT VHF SABER FOR HIGH SPLIT++++

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: hq54@aol.com
Message-ID: <19990601185715.15309.00001421@ngol02.aol.com>
Source record: 106737

Hi All,

I have a low split, high power VHF Saber that covers the HAM band in 2 meters, that I would like to trade for a High split VHF that goes to at least 173 mhz. Please E-mail me if you would like to trade, or even if you want to sell it outright.

Thanx
Mike

5321. Omni VI versus 1000-MP

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: Greg Mason <mason@pra.ca>
Message-ID: <j7_43.168$z5.23737@news1.mts.net>
Source record: 106738
Body handling: Inline uuencoded payload not displayed: Greg Mason.vcf

I am trying to decide which rig to purchase. The Tec-Tec Omn i VI plus or the Yaesu 1000-MP. Thoughts on this would be most appreciated. I am aware of the differences (e.g., gen coverage for the 1000-MP) and have read the QST extended reviews. Now I am seeking information that is not in the reviews.

Thanks

Greg VE4AMN

Message-ID: <3f_43.689$tj6.37039@dfiatx1-snr1.gtei.net>
Source record: 106740

Nice, but the antenna is too big for my installation. The T6 has a turning radius of 20 feet. Also, the wind load is doubled, 7.0 sq. ft. verses 3.2 sq. ft. for the MA5B.

Sean - K3XT

5324. Yaesu FT-900AT - $795

I don't have the VX5R, but I do own several other Yaesu's. As a brand
they are very good at intermod rejection.
The Rochester (NY) hamfest is this weekend, and I hope to have the VX5R
at the end of it, I'll try and test it out for you!

Source record: 106743

Make sure that the one you get is the TH79D (D for Deluxe) They made
some additions to the radio after people complained that tit did less
than the 77 and 78. The "D" is the version with those additions.
Good luck.

From: Richard Ferguson <raferguson@worldnet.att.net>
Message-ID: <375483EF.4429ACC2@worldnet.att.net>
Source record: 106745

I suggest a minimum of a 1/4 wavelength on the lowest frequency
that you plan to work. 1/4 wave on 40 meters is about 10 meters,
so I suggest 35 feet minimum. Actually, you want to avoid a
multiple of 1/2 wavelength on either band, so I suggest 3/4
wavelength on 20 M, or 15 meters, which is about 50 feet.
18 gage wire should be plenty for 100 watts or less, radio shack
sells coils of copper wire for this purpose.

I have a Motorola HT1000 UHF 5watt 450-512mhz 16ch w/scan MDC ect.
Will have programed to meet your needs comes with 2 batterys and ant.
Note: will do all of 440 band as well!

Also a Saber II UHF 440-470mhz 5 Watt 120ch. 10 zones 3 button
alpha/numeric display comes with battery and antenna.

Radios are both in excellent shape,saber II has worn enter button
still works 100% functional!

Want to trade for a Alinco DX70TH HF/6M complete in 100% working cond.
nothing beatup thanks.

Will consider cash sale as well.

Please reply only to e-mail address below thanks for reading...sk

I talked with the owner of Kachina last year about different ways
to remote. I felt that one could use a network card instead of a
modem. What I wanted them to do is to have a slot (PCI) that one
could add whatever one wanted.

I don't normally reply to comments like yours, but since you decided to make the comment, I will respond. I purchased the radio for 1830.00 dollars. It has never been opened, used, touched, etc. etc. etc. Right now you can purchase a new one for 1499.00 that's 1699.00 with a $200 rebate from Yaesu. That is not the permanent price, but a special short time deal. I would appreciate it if you have not interest in buying someone's equipment, that you refrain from commenting on someone's post!

Thanks,

Dave Conlee

5339. FS: New Roller Inductors

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: k9sqg@aol.com
Message-ID: <19990531202154.27348.00004974@ng66.aol.com>
Source record: 106863

Have for sale, three roller inductors. None have ever been in service and look brand new, the older "single" one is dusty but should clean up sparkling clean.

Have two of the following:
24 uh, 22 turn edgewound roller inductor. Has dual contact arrangement that eliminates electrical "skipping" during rotation prevelant with most single roller/contact inductors. Has a potentiometer gear driven for an electrical position indicator. Has an insulated switching mechanism that activates at about the mid inductance range. The inductor is rated at 20 Amps. The construction is similar to the 40 uh one on page 66 of Surplus Sales of Nebraska catalog (it sells for $245). This 24 uh inductor was selling for $219 each by Surplus Sales at the Dayton Hamvention this year. I am selling both as a pair for $175 total, shipped to your door, conus only.

Have one of the following:
29 turn edgewound roller inductor, dusty, but apparently never used. The coil itself is 3 1/2 inches in diameter with a length of 6 inches. It has dual rollers to eliminate "skipping" during rotation. This is every bit as beefy as the ones above. All insulating surfaces are ceramic. Has a ceramic insulated flex coupling. The ends are triangular shaped but the corners are rounded. Selling for $75, shipped to your door, conus only.

If you have a high power amplifier, tuner, or antenna project in mind, these inductors will do the trick.

Thanks for reading the ad.

73

Evan

Hi,
Name here is Denis.
I just got a Tad M8 mobile VHF radio with no manual.
Need info:
How to re-program it to 2Mtr. freq.?
Do I need a programmer for it?
Does it have a E-prom to be burnt?
With no information on it and no manual
A fellow is lost......HI...HI...
Any help would be appreciated
Thanks in advance Denis VE3HVS

I am trying to interface a the new Kenwood digital radio with my computer to display the stations heard with my Street Atlas moving map display.

Since I don't really need an APRS program with the TH-D7A a clever way of automatically moving the beacon locations from the radio to the computer would work just as well.

BTW I have the GPS feeding both the Kenwood and the computer simultaneously. If you want the details drop me a note.

Get on the mailing lists!!
www.onelist.com/subscrive/YAESUVX5
www.onelist.com/subscrive/icomT81
I was a die hard Icom fan till I got the VX5
Its got this amasing incredible userfriendly control,
its called a volume knob!!!
I just wonder how good the "games control" on the T81 works when its in
the softcase from Icom?
From my experience with the T8 I think the PA is more robust and
intermods are better, as well as more sensitivity in certian bands(800)
however it is not as wide RX as the VX5.
SW is a nice option. Esp with the SSB module.
cheers
Eric.

I fail to see how knowing Morse Code will help you learn how to operate
a radio. I do not know Morse Code and can operate a C.B. Radio, FRS
Radio, Shortwave Radio, Scanner Radio...

5353. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7ivt03$qig@news.Hawaii.Edu>
Source record: 106877
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6O
(rec.radio.amateur working-group)

From: Werner Roedl <roedl@ibm.net>
Message-ID: <3753B259.7A95B905@ibm.net>
Source record: 106882

I have a ADI AR 146 mobile rig which is locked to 144-146 Mhz.
How do I unlock it to have expanded RX ?
TX will expand by cutting the obvious wire on the bottom PCB but for
this RX has to be expanded first !

I need to use the radio outside Austria !

kind regards,
Werner Roedl

5359. IC-211 restoration story

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: "JOSE V. GAVILA (EB5AGV/EC5AAU)" <eb5agv@ctv.es>
Message-ID: <3753B630.4E38B369@ctv.es>
Source record: 106883
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

Hello!

Some time ago I bought an IC-211 in 'as-is' condition from Canada (I live in Spain). With the set, I got a desk microphone, DC power cord and manual photocopy. Well, it arrived to Spain some days ago and the power switch and a the RIT toggle switch were broken, so I couldn't check the set... I contacted Icom technical support but these switches are no longer available. So I finally decided to replace them with suitable replacements until I (hopefully) find the correct ones. The ON/OFF switch was replaced by an standard sliding switch I found in my junkbox. I just needed to adapt it to the original metal bracket and figure how the wiring should be done, as the original switch is somewhat different than standard sliding switches. Regarding the RIT toggle switch, as I was not able to locate an exact replacement, I used the original metal bracket (once the old switch was removed from it) to support an small standard pushbutton, with the original switch cap glued to it. The looking is very good and the only difference is that it is not a toggle but a push button.

Well, I powered the set and... it worked!!!. I got nice red glowing digits showing the usual 144.000.0 starting frequency. Scanning the band I got good signals here and there, with S-meter deflections up to full scale. I was happy :-)!!!. Then some minor troubles arised (happiness is never full, hi!): the speaker distorted from about 25% audio level and the LOCK button was inoperative. Well, not too bad!. I enjoyed some local FM QSOs and let the rig powered for a while. Then went to the computer keyboard to work a bit and, when I looked again to the IC-211... the red digits had vanished :-(!. Gently tapping the rig I could got them back for a while and them got them blinking and finally off... Hmmmmm... I had read about the PCB layer interconnection troubles and suspected that was the cause. By the way, when I was first working on the set, I opened the PLL cover (it had been opened previously, as the label was cut) to find that somebody had done the 'hard work', redoing all PCB vias. Also, the PLL chip was in a socket (I am not sure if this is stock for late units) so I closed it again. But the rest of printed circuits seemed untouched.

I let the rig on the shelf until yesterday, when I moved it to the workbench to attempt repair of the three troubles: LOCK button, speaker and display. I took off the top and bottom covers and removed the four big screews which fixed the front panel, to gain access to the display board. Tapping it I could get the display working from time to time, but I couldn't find an exact point to get it working. So I took apart the display circuit, disconnecting the three linear connectors. Looking

carefully I could see it was a double sided PCB with the dreaded interconnection vias. As the display went completely dark I suspected of a power connection failure. Some power lines go from side to side on the PCB so I decided to rebuilt all the vias by putting a wire on them and soldering both sides. I also soldered at both sides the IC and discrete component pins which had a via on them. About 50 or so vias were fixed. Once I put back the circuit, I got a full bright display and, as a bonus, the LOCK function operated correctly :-) :-)!. I tapped again the circuit but the display remained on. Hooray!!!

The I went for the speaker trouble. Once I got it removed (three screws), the problem was evident: it uses a circular hard paper piece to separate it from the metal cover. It has four radius and one of them was so bent that when the speaker cone moved, touched it, distorting the audio. Once this was fixed, the audio sounded loud and clear. Good!!!

So I got the IC-211 back to its operating position on the shelf and enjoyed another QSO until I got bed... Now the display is bright, can be locked and I can get full audio from the rig... What else could I ask ;-) ?

Hope you have arrived here and are not too bored...

Best regards from a happy camper!

JOSE

This message comes at a very opportune time for me, as I have been bitten by the HAM bug as well. I live in FL (so I don't forsee large landmasses being a problem with my radio transmissions), and I was wondering just what type of equipment would be best to purchase (I'm going for certification in the end of June and I'd really like to have a unit here for when I recieve my FCC license (I can hardly wait), however while browsing through the back of the latest QST mag I saw so many units with so many different features that I don't know what I should be looking for. I understand that my Technician license will not allow me to utilize all of the amateur bands, but I would like to get a radio (preferably not a handheld) that won't limit me too much in my beginning operations (IE- I don't really want a very low-powered unit, and I'd like to use 2m and possibly 440mhz [as well as whatever I might need to do packet data between two computers]). Anyone have any recommendations? (I'd really like to keep it near $700 or below, since I don't want to waste a huge chunk on equipment I'll replace in a few months as I upgrade classes.

Thanks for any insight/help in advance.

Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.swap,alt.music-lover.audiophile.hardware

Hi folks :) I'm an electronic musician *seriously* looking for the following musical equipment, in any condition, even broken:

-OLD SYNTHESIZERS (from the 60's-80's)
-OLD KEYBOARDS (w/ knobs or sliders)
-OLD DRUM MACHINES
-OLD SEQUENCERs (w/ knobs for each step)
-OLD VOCODERs ("robot-voice" sound)
-MODULAR PATCHABLE SYNTHESIZERs
-RACK SYNTHS
-INTERESTING EFFECTS and anything related to the above.

-Moog, ARP, Korg, Roland, Sequential Circuits, Oberheim, Yamaha, EML, Electrocomp, EMS, Synthi, Putney (VCS3), RSF, Buchla, Serge, Polyfusion, Ionic, Paia, SMS, Wavemaker, E-mu, Steiner-Parker, Chroma, Aries, etc.

-Oberheim Xpander
-ARP 2600
-Korg MS-20/50
-E-mu SP-1200 Sampler Drum Machine
-Sequential Prophet VS rack
-Simmons SDS-7 + SDS-5 + SDS-6 Drum Brains and Sequencer
-Pearl SY-1 Syncussion

For a better idea, please visit
http://members.aol.com/rolandman1/index2.html

If you have any of the above OR SIMILAR for sale or know someone who might, please email me at rolandman1@aol.com and include phone number as well if you'd like.

Thanks in advance and apologies if this post annoys anyone.

5365. 6m SSB or FM?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: kb0pqe@my-deja.com
Message-ID: <7j0p7q$5ts$1@nnrp1.deja.com>
Source record: 106889

I'm considering buying a "low-cost" 6m rig buy I can't decide between FM and SSB. The MFJ-9406 looks like a fun SSB rig. However, the Alinco DR-M06TH looks nice for an FM only rig. Repeaters in my area don't seem to have any 6m activity so I'm tending toward the MFJ SSB. Anyone have thoughts that might help me decide.

Thanks for your time,

Scott, kb0pqe

>You could, at least theoretically, do sub-Nyquist sampling.

Not practical in this application. Since the TV signal is broadband,
you'd have to do multiple subsamples across the span and recombine
them without losing phase coherence. I don't see any practical way
to do that with audio rate DSP chips.

>The catch would be like using a strobe light: while you can
>flash (sample) at any convenient sub-multiple of the item
>you're looking at, nothing significant must happen during
>the flash. This translates into a moderate sampling rate
>(definitely in the soundcard/DSP eval kit range) but a
>very fast sample and hold ADC (which is not).

Where subsampling is practical, IE a band limited narrow
band signal, you can add an external fast sample and hold
in front of the sound card's A/D. This can be done easily and
cheaply. But you need good bandlimiting, IE tracking preselector
filtering, ahead of the sample and hold, otherwise you'll get alias
artifacts that you don't want as well as the alias down conversion
that you do want. You won't be able to separate them at baseband.
It is this requirement for tight tracking preselector filtering which
makes this approach impractical for a HF amateur band receiver.

From: confondere@my-deja.com
Message-ID: <7j115u$8s0$1@nnrp1.deja.com>
Source record: 106894

I am considering purchasing a used Icom IC-W32A for around $200 and I have read numerous articles on the web about the mods. In particular I am curious about the extended receive mod. What is the frequency range and more importantly, is it sensitive receiving outside of the 2/440 bands?

I have used a few Kenwoods that claim to have AM receive for aircraft, but unless I was within 4 miles of the local airport tower it was less than useful.

I am sure the price is not outstanding, but is $200 a decent price for the radio? Is there anything negative or positive I should know about the radio?

Any information would be appreciated.

Thank you,
Andrew

Two things: Higher negative bias voltage is needed to cut off the tubes
when in standby. This possibly could be done by going to a voltage
doubler for the bias supply. I do not have a schematic for the unit. It
is also possible to add a fillament transformer connected backwards to
make the AC voltage for the rectifier for the bias supply. The second
thing would be the possibility of parasitic oscillation. See
www.vcnet.com/measures/ . Rick has much information on this subject.

These self apointed guardians of the public good are just cop wannabes. They give me a pain in the ass also. An interesting side effect of all this noise occured when I was at Dayton.

Now I have done business with RT for years I go to a lot of hamfests every year and more than half the time have bought something from RT, be it an HT or a DSP for my 706 or whatever. This time when I saw their booth I thought about this Bradford jerk and did an about face buying a $400 HT from another vendor.

I realized Bradford doesn't work for RT but I just find his crap so disgusting that I no longer do business with RT because of him.

A public statement by RT that Bradford etal do not represent their firm would go a long way toward repairing the public relations damage he has done.

>73-Still happy with Omni VI PLUS here.
>Jim, K4SQR

I had a chance to look the Pegasus over at Dayton. It is a nice rig for what it is, but it is a low end rig. They designed to a price target rather than to a performance target. LO phase noise is pretty high and 3rd order intercept is pretty low by today's standards. Two tone IMD is excessive. Etc. Not a bad rig for the price, but the Kachina is much better in each category.

I discussed these issues with the designers. They acknowledged that they designed to a particular price target. But they also took to heart some of my comments and said that they might still improve the analog RF section of the radio before it is released for sale by substituting a different LO and possibly reworking the first mixer. They said that the PA was straight out of the Omni VI, and I said that if that's true I don't want an Omni VI. They didn't like that, but a two tone IMD spec of -23 dB just isn't acceptable in today's crowded bands. It makes you a bad spectral neighbor.

I wasn't all that impressed with the operating software either. It was functional, but just copied a conventional radio, IE just gives you a conventional front panel implemented in software. OTOH, the Kachina software is much better. It actually seems designed from the ground up to be computer operated, and fully exploits the ability to use multiple scalable windows and the mouse to drive the radio in a fashion suited to computer operation. (Of course Kachina has had longer to think about and refine their radio. TenTec has done fairly well for a first effort, but they need to think outside the box a little more on their user interface. It shouldn't look and act the same as a hardware front panel. That model just doesn't work very well for a computer operated radio.)

I also talked to them about documentation for their API so that third party software can be written for the radio. They were slightly evasive about that. One of the designers made a backhanded remark that it would be reverse engineered soon enough. OTOH, Kachina is very open about their API and offer third party authors all the information

they need to write software for their radio. I talked to Kachina about a Linux port and they were very supportive. What I'd really like to see TenTec do is take an open source position with regard to their software, IE a GNU style copyleft. That could only help sales of the radio, and it would be a welcome change from the policies of some other vendors, like Icom and Yaesu.

Looking inside the Pegasus, the first thing you notice is that there isn't much circuitry there. Almost all of the radio is done digitally in firmware. TenTec has been more aggressive here than Kachina (whose box is *stuffed* with circuitry). That's fine, but the analog portions that are there are below the standard I'd expect from TenTec (as noted above). That hurts what otherwise could be a very attractive radio.

I hope that they follow through on my suggestions and fix the things I mentioned before releasing the radio. But even if they don't, there is *plenty* of room in the radio for us to add circuitry to fix the problems the radio exhibits. At its price point, it would be worth buying just as an experimenter's platform if they went to open source software. But both a closed architecture and mediocre analog performance sharply diminish its attractiveness.

Does Yaesu have a scope compatible with the FT-920? Similar in operation to the SM-220 Kenwood.

I'm looking for a small HT repeater controller similar to the Spectrum Electronics HT Repeater Controller. My need is for temporary crossband repeater set up using two HTs. Commercial products or schematics welcomed.

Thanks.

FS: AOR-3000

Made by AOR. Here is a general description of this
receiver scans freq. from 0 Mhz to 2.03 Ghz.
It's all mode, search, free scan, clock, date,
alarm, sleep, and much more. And I have Proof that
it went to AOR to get a check up to replaced
lithium battery and to make sure that it on
frequency. The date of invoice is 3/5/99 with invoice number.
And this is there i ship it to:

AOR U.S.A.
20655 S. Western Ave. Suite # 112
Torrance CA 90501
Tel. 310-787-8615
(This info is for people who needs AOR address)

Good working CONDITION.

1) I have manual for it,
2) Mobil plug & Extra cord.
3) I am also including a RADIO SHACK 12 volt power supply.

All for $725.00
That Includes S & H And Insures 2 day air.
Will e-mail you and call you with
tracking number.
I'll ship anywhere in the USA ONLY.

Accept Prepaid (Postal) Money Order

If send a bank check you MUST wait 10 days
to clear!..

If you like you can e-mail me with your
telephone number and I'll gladly answer
any questions you have.

5385. Re: New Ten Tec - Pegasus LOW BAND!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: ke4zv@bellsouth.net
Message-ID: <377b1172.654889375@news.atl.bellsouth.net>
Source record: 106909

On Thu, 20 May 1999 12:28:03 -0400, Chuck Murcko <chuck.murcko@platinum.com> wrote:
>The 706 fairly compares to neither new Ten Tec rig. I've read the
>specs on both these rigs, knowing Ten Tec has a track record of actually
>delivering what they measure, not promise.

True, but have you taken a hard look at the specs for the Pegasus?
Not so hot are they? I got some hands on time with it at Dayton and
chatted with the designers. I'd rate its receiver as no better than the
IC-706, maybe not quite as good. It definitely doesn't hold a candle to
the Kachina (no surprise there, of course, it costs half as much).

Its synthesizer has *way* more phase noise than is acceptable in a
modern HF rig. The analog front end has much too low a 3rd order
intercept. And the PA has too much two tone IMD to be a good spectral
neighbor. The software is pretty uninspired too, and only runs under
Windoze.

There's a lot of potential there, but they don't have it right yet. They
need to clean up the synthesizer, beef up the first mixer, and clean
up the PA to make it minimally acceptable. They also need to open
up their software so third parties can produce a better user interface
than their uninspired offering.

Being stuck using Windoze and proprietary software is *not* a feature.
They should go open source, ala GNU, so we can port the user interface
to a decent OS like Linux, and make it more functional for the computer
operator. A software emulation of a traditional hardware front panel doesn't
cut it. If may *look* familiar, but it doesn't *work* familar. A computer radio
has to have a different sort of user interface if it is to be easily and comfortably
operated with a keyboard and mouse (and perhaps joystick).

Kachina has it almost right. They fully document their API and encourage
third party software, including ports to other operating systems. If TenTec
were to take an even bolder step in that direction, they might have a winner.
They should realize that they're in the business of selling radios, not software.
If open source software will sell more radios, and it will, then they should go
open source and open architecture. They have the oportunity to set an industry
standard that could have as big an impact as Linux has had, or as IBM had
when they decided to make the PC open architecture.

>suggestions or impression from first hand users

I've done it all the different ways. I have a FT847. It is not a bad radio,
but it isn't a great radio either. I use it a lot because it is convenient
(I have it in the computer room rather than the ham shack), but when
the going gets tough, it isn't always up to the task. I also have a IC706,
I use it mobile, but wouldn't want to have to use it as a primary station
radio. My IC275H, IC475H, and IC735 driving a MLA2500 in the ham
shack beat them both soundly. But then they should, they all were, or
still are, top of the line radios. I used to have a FT736R, and had a
(horrors) TS790A. Only the latter radio was really horrid for satellite
use.

What I'm trying to say here is that there are few really bad radios
out there. Almost anything will work pretty good. But top of the line
separates still rule for satellite operating, and a good HF rig is still
a good HF rig. The combo radios fill a niche, and may be just what
you want, but if you're looking for an ultimate station, they aren't the
way to go. Yaesu tried that once with the FT767, which at the time
was a no compromise HF radio with optional 2m and 70 cm modules,
but no one does that anymore. The combos are now built to be mid-line
or bottom line radios. If you want the best, you have to buy separates.

>I had to work so I could not go to Dayton this year.
>Other than lower crowd size, was there anything that
>one could be excited about? New products?

TenTec had two new radios, DSP based and computer controlled (like Kachina). Interesting, but not quite there IMHO. Kachina had two new remote control options for their radios, slick. Icom had their radio with a TV screen. I don't know what good it is, but it was pretty. Yaesu gave me 3 new hats. Outside, KMA had some nice LP antennas for sale. I bought one for 6m. (These are good.)

I looked for SMD parts but didn't find any I needed. I did get a good deal on some finger stock for my 2304 amp. But the highlight of the hamfest for me was a fellow selling out the contents of his machine shop. I got Starrett, Brown & Sharpe, Proto, General, etc at incredible prices, also picked up some stepper motors for my CNC lathe and a couple of gear head motors for a power feed for my mill.

The weather was perfect, there was plenty of good junk to peruse, and it wasn't stifling inside. The buses ran on time, and some of the hamfest food was even edible. Nothing really startling was announced, but it was a very good hamfest. Sales appeared to be brisk inside and outside. I resisted buying any more computer junk this year (though there were some good deals, especially on 17 and 19 inch monitors). I found a great deal on a Watkins-Johnson receiver, but it was just too big for me to manage on the bus. Next year I've got to get a flea market space so I can wheel the boatanchors to the truck. (Or maybe I shouldn't, when I do have a flea market space I wind up hauling more back than I take.)

Mine works fine on FM broadcast and TV audio, but on the AM broadcast band you need a different antenna to hear anything. A longwire will work, but as you say it isn't very practical for shirt pocket use. You can rip a loopstick antenna out of an old transistor radio and put a connector on it (hot glue or RTV). You have to salvage the tuning capacitor too, because the antenna will be narrowband, and it'll look geeky, but it'll work.

5395. Cushcraft new MA5B mini beam

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: Sean Baxter <XXXsbaxter@gte.net>
Message-ID: <ywW43.436$tj6.27391@dfiatx1-snr1.gtei.net>
Source record: 106919

All:

Experience of installing and using Cushcraft's new MA5B, 5 band 3 element (2 driven) mini beam.

I ordered the antenna from HRO and to my surprise it arrived 2 days later from the VA store. Costs $300 US.

The antenna is well built, traps look to be heavy duty with stainless steel fasteners throughout. No missing parts. Instruction manual is easy to read and understandable assembly instructions. However, because of the X hat end of elements you need to have at least 2 saw horses to set the antenna on while you connect these X hats on to the end of the elements. Also, I would strongly recommend wearing safety classes with these X hat elements sticking up everywhere. When assembled the antenna looks like a porcupine. You can not put the antenna on the ground without bending these X hat elements. Care must be taken to align the X hats to 45 deg. to the boom while at the same time making sure the drain holes of the 6 traps are facing downward. Innovative design in that the only band to tune for (element length) is 20 meters. Took me 3 hours to assemble.

On air performance. I compared the MA5B to my trusted Caroline Windom coax fed wire antenna at 40 feet. The MA5B was installed at 35 feet.

20 meters, disappointing. Signal strength was never better than the C.W. At times signal was equal with the added help of some side lobe attenuation. Signals on the C.W. were stronger most of the time. Only on local stateside (high angle) signals did I see any front to back ratio (10 db on one signal). Lowest SWR I got was 1.5 to 1, and band width is only about 150 khz. Need antenna tuner to get full output at band edges. I will say that I tuned the element lenghts for 14.175 Khz per the manual and when installed the lowest SWR was at 14.190 khz.

17 meters, looks good. Signals on the beam was equal to as much as 2 S units (about 10 db) better than C.W. SWR 1 to 1. Beam nothing more than dipole on 17 meters. The Caroline Windom seems to degrade in performance on frequencies above 14 mhz and gets worse the higher in freq you go. Even though the beam is only a dipole on 17m, the signals were noticeably stronger because of this characteristic of my C.W.

15 meters, looking real good. MA5B was consistently 2 S units better than the C.W. I could see a front to back of about 10 db as well. SWR 1 to 1.

12 meters, looks good. Beam was about 6 db better than C.W. Beam only a dipole on 12 meters. SWR 1 to1.

10 meters, best yet. Beam uses 2 elements on 10m. About 2 S units betters than C.W. Good front to back. SWR 1 to 1 and almost covers entire 10m band with 2 to 1 SWR.

All in all I like the antenna. With my limited antenna mounting situation, this antenna helped my 10 through 17 meter signal strength performance.

Some Specifications:

Elements: (2) on 10m,15m & 20 m bands. (1) on 12m & 17m.
Gain (dBi): 10m-5.3, 12m-1.0, 15m-4.8, 17m-1.0, 20m-3.6
Boom Length: 7.3 feet (2.2m)
Turning Radius: 8.8 feet (2.7m)
Longest Element: 17.1 feet (5.2m)
Weight: 26.5 lbs. (12kg)

>
> --
> Richard
> Hi Richard,

The all the above radios are good as mobile radios with a mobile whip
and perform reasonably well.
The FT 8100R has the most sensitive receiver but in a built up area
this may be a problem. The IC 207H and the 2800 H both are not as
sensitive as the FT and have small displays when compared to the TM-
G707E the receiver on this is as good as the FT8100R but the display is
bigger.

This does not make the choice easy but a taxi friend of mine has an
FT8100R at home and a TM-G707E fort the car and he states that was the
best option.

If I remember correctly, the FT-50 does dual watch, but not dual
receive.
Most of the newer HT's have the dual watch capability, but only the
better ones have the true dual receive capabilities. Look at the
Yaesu FT-51 or the Icom W32A for this.

Hello All,

I have a web page that has info on Satellites & Satellite Tracking, as
well as Yaesu, FT-847, FT-50R, HF/VHF/UHF, HF Rig Reviews,
Tons of useful Ham Radio Resource Links, plus many other useful
resources.
Please check it out:

http://kq6mu.8m.com

Webmasters:

Please add me to your links section. In return, I will add you to my
links section.

Thanks & 73,

Mike Green KQ6MU

5404. Kenwood SM-220 connectivity?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-01 00:00:00 UTC
From: "Paul B. Peters" <pbpeters@bc.sympatico.ca>
Message-ID: <375451BB.42943252@bc.sympatico.ca>
Source record: 106928

I have the opportunity to purchase a Kenwood SM-220. However, I am not able to determine if the SM-220 will work properly with my Kenwood TS-850. I know the SM-230 is the exact match for my TS-850. Is anyone using the SM-220 with a TS-850?

In 25 works or less, can someone explain (briefly) what a PAN adapter does? How would I know if the unit was installed in the SM-220?

From a cosmetic perspective, is the SM-220 a color match for the TS-850?

All comments would be appreciated.

Paul

Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.repair,rec.radio.amateur.equipment

Howdy....Attempting a repair on my Bird Hammate model 4360 (hf) wattmeter. The pickup has at least one burnt resistor....appears to be 35 ohms...wonder if anyone can confirm this (the remaining fragments are pretty small!). Of the remaining components part of the pickup assembly, there is a glass encased axial lead device which quickly looks like a diode but lifted shows no junction voltage/difference (short) either fwd or reverse....it is a little different looking than diodes I've seen and wonder if anyone can confirm that it (was) a diode or is something else (fuse maybe?). Daring to ask...does anyone have a schematic for this little wattmeter who could describe the components of the pickup (rotating directional coupler) assembly re values etc. Thanks - See if I can get my fleamarket "prize" working LOL.

This may not be pertinent, but I have an AL-811H. Lots of the noise in it is really vibration of the case. I put a couple of bricks on top, and that really helps.

Someday I may find a quieter fan, however!

5417. Re: IC-706MKII Squelch ?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-02 00:00:00 UTC
From: roncook@worldnet.att.net
Message-ID: <375477e6.615435199@netnews.worldnet.att.net>
Source record: 106757

Hi,

If I'm reading your question correctly:

Go into Initial Set Mode by powering-on the radio while holding the
"Lock" button in.

Press the "Menu" button or rotate the "M-CH" dial to menu option 21:
RF Gain.

"When this item is set to ON, the [RF/SQL] control can be used as the
[RF] gain control in USB/LSB, CW/CW-R, and RTTY modes as as the [SQL]
control in the FM and AM modes.
When this item is set to OFF, the control functions as the [SQL]
control regardless of the operating mode selected."
(from IC-706MkII manual, page 47)

The default setting is "OFF".

To change the setting from ON to OFF, or the reverse, rotate the large
main tuning knob until the desired symbol appears on the display.

To exit Initial Set Mode and save the setting, power-off the radio and
power-on the radio.

Hope this helps.

>> from the VA store. Costs $300 US.

Sean,

I bought mine from HRO at Dayton (they had a special going)
for $229.00 plus $8.00 shipping. I got better results with mine than
you did on 20 meters. I tuned mine for the voice section of 20
meters, put it on a roof TV tripod mount and used a Radio Shack TV
rotor to turn it. I got very good directionality at about 35 feet
high. My assembly experiences were similar to yours. SWR was pretty
good (below 2.0) from 14.230 to about 14.350. I think it's a great
antenna for folks who are space or tower limited. My standard of
comparison was a Cushcraft AP-8 vertical antenna (a now-discontinued
1/4 wave vertical with about 40 radials under it).

I was able to do an A/B comparison between the AP-8 and the
MA-5B with a VK station from Australia at 6 AM EDT on Monday morning
on 14.260 MHz. He reported about 3 S-Units when I transmitted a CW
carrier through the vertical with about 500 watts. When I switched to
the MA-5B, he reported about 5 S-Units. I found his signal to be
quieter through the MA-5B than through the vertical when I was beamed
at him. I could barely here him when the MA-5B was broadside to him.

Since I live in a small city house, this antenna allows me to
operate a bit better than my vertical on 20 through 10 meters. I
think that I'm heard better now through the 20 meter pileups. I
highly reccommend it. I DO think that it's a rip-off to charge
$237.00 to one customer and $300.00 to another just because of Dayton.
I think that Cushcraft or HRO owe their customers an explanation.
I would buy this antenna for $229, but I don't think that I would for
$300.00.

5424. FS: Kenwood TMV7-A and Yaesu FT-530 HT

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-02 00:00:00 UTC
From: hodgesmn@email.uc.edu
Message-ID: <7j25kvfaj1@news.ececs.uc.edu>
Source record: 106764

Looking to sell the above two radios.

1) The Kenwood is in mint or like new condition. I have two of these and am selling one. I was planning on using the other one as a base but my parents refuse to allow me to put an antenna on the roof. So, that means I don't have any use for one of the Kenwoods so I figured I'd sell it and let someone else use it. The only time it was turned on was when I modded it to do the expanded RX/TX frequencies like GMRS to verify I modded it correctly which I did. I still have the manual and warranty card for this radio too. I've been told this radio sells brand new for around $440 and I've seen it for $425. I'm asking $350 for a like new radio plus S/H and insurance.

2) The antenna that I was going to use must be sold also. It is a Comet GP-9 base antenna. It has a good SWR across all bands. I paid $162.50 for it (sticker is still on the package) and would like to get $150 for it plus S/H. The antenna has never been used.

3) The 530 is in good condition. I have an extra keypad for it that I have not installed yet since the numbers on the other one are not worn off yet. I got it basically for nothing at the time I bought it so I figured I'd get it now and have it when ready. The radio comes with two 12V, 1300 mA NI-MH batteries. I haven't used these that much, maybe <10 times each battery. I will throw in a Radio Shack basic shoulder mic (about a $15-20 value). I also have one of those RoboCharger quick chagers that I would sell with it too. Looking to get $210 for the radio w/o the quick charger and $260 for the radio w/ the quick charger plus S/H and insurance.

All prices are negotiable to an extent. If interested or if you have any questions, email me at the above address.

5432. 1st Shack - help?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-02 00:00:00 UTC
From: run2hills@aol.com
Message-ID: <19990602012709.07936.00000382@ng-cs1.aol.com>
Source record: 106772

Greetings!
I am finally ready to invest in some radio gear, and am looking for a "compact", versatile, rugged, yet effective base/portable/mobile station. If I may, I would like to pose this question to the group:
What is the best setup to achieve the above functionality? Your comments would be greatly appreciated. The following is my current wishlist:

1. Icom 706MKIIG
1a. temperature controlled transmit oscillator
1b. ut102 voice synthesizer
1c. fl232 350hz rtty/cw filter
1d. fl223 1.9khz IF ssb filter
1e. ut102 voice synthesizer
1f. opc587 16' separation cable
1g. mb 62/63 main unit / front panel mounting brackets
1h. hm77a DTMF mic (better dtmf mic? remote control?)
1i. mb72 carrying handle?
2. MFJ 934 combo tuner / artificial ground
3. MFJ 4225mv switching 22 amp power supply
4. Ameco k-4 brass straight key (for starters;)
5. battery / solar panel (help?)
6. random, j-pole, dipole, counterpoise wires
7. Pelican watertight case (better field op case??)
8. automotive "spout" type connectors for all power connections (?)

Thanks again

I have a BK EPH series portable and need to find out something about it. It will only go down to 148.00 and I would like to use it on 2 meters. I know that the EPI series will do this. Is there any way to make my EPH go down to 144.00? Is there a difference in the hardware between EPH and EPI and is there anything I can do to modify it. Any help or source of information is greatly appreciated. I have searched the web and found very little about BK Radio. Thanks in advance...

5436. ICOM 745 fixer-uper or parts radio.

IC-745 in inoperative condition and being offered as a fixer-uper or parts radio.
It powers up but has no display indication or reception/transmit.
Exterior has no damage but paint is rough and inside is clean with all boards intact.
Standard filters. No accessories. No mike or manual.
$225 + shipping.

Why? because it spoils your chance of making some extra bucks from some
unsuspecting person.

We have just had the same situation in the UK on the UK amateur ng. End
of the discussion was, if you don't like it, post elsewhere or use a
magazine. Its an open ng and everyone has the right to reply. Even you.

Hello FW:

I would remove the GFCI breaker and replace it with a regular 15 amp breaker. Then replace the outlets in the rooms you mentioned with duplex GFCI outlets. Many of the new GFCI breakers now have a monitoring chip that senses current changes. This chip could be the culprit of your RFI.

5445. FT-280 v FT-480

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-02 00:00:00 UTC
From: Paul.Wilton@roke.co.uk
Message-ID: <Paul.Wilton-0206991318180001@samac.roke.co.uk>
Source record: 106785

Can anyone please advise me the differences between a Yaesu FT-480 and an FT-280? From a visual inspection, if appears that on the FT-480, there are 3 switches underneath, one for SAT, one for auto-tone burst plus one other. On the FT-280, the simplex/repeater shift control is one of the two switches underneath, the other switch being SAT.

A couple of key questions that I would like answered:

1) Is there a 1750 Hz tone burst for repeater use?
2) What is the power output?
3) Is the RF performance comparable with the FT-480?
4) Is a FT-480 worth more or less than a FT-280?
5) Does it have UK FM channel spacing (ie 25 and 12.5 kHZ)

My main interest is 2m SSB rather than FM.

I would appreciate if replies could be copied to my email address as well.

Hi Goran,

I have used both your program and ADMS with the template modifying software and it seems that some of the newer VX-1 radios can not be modified via software. Your program indicated that my radio had already been modified for MARS/CAP but in fact it still does not transmit out of band. My firmware is V1.06 and the radio os about 1 year old. If you have some other suggestions I would be glad to try them.

Thanks to you for your software and interest in helping other hams.

I'll bet! Considering that my 6 meter Ringo is about 10 ft long, and
that is a fairly minimal antenna, it isn't surprising that the VX-5R's
"club" doesn't quite measure up.

I wonder if there is a portable solution? I guess a twin-lead J-Pole
might be one. do you know of a commercial product, Gary?

Love my VX-5R, even for just 2/70 bands.

Phil

be sure CW switch on top left of radio is set to either semi or full or you
will have to manually key the radio to send via the send/receive switch just
above the mike connection.
also the CAR adjustment (to the right of display) will need to be turned up
some.

hope it is something this simple....
good luck

I've come across an old GE RF amp, good for 42-54 MHZ. It was used for FM in the 42MHZ range. The model #is 4EF4A3, FCC # is FCC-EF-4-A. I would appreciate help from anyone who might be familiar with this model, and how easy/difficult it is to convert to 6M (linear) use, or any technical info on it.
Please reply to my e-mail address.
Thanks

Steve

DavidC-

I live across the state, but frequently visit the St. Petersburg area. I know there is activity in the New Port Richey area, but don't have specific info.

There is also a group of wide-area repeaters in nearby Holiday, one on each band.

I suggest you look in the ARRL Repeater Directory for repeaters in that area. Check their call signs in the QRZ data base at http://www.qrz.com/database.html. If any have E-Mail addresses listed, send each a note asking for advice on which repeaters are active.

I am interested in learning about HAM radio.

My neighbor was knd enough to loan me his ICOM t22A handheld.

I am not going to transmit but only listen.

So far I havenot been able to do anything. Neighbor is busy on a
project and won't be able to meet with me for a couple of weeks.

Can someone give me a place to go so that I can learn how to listen to
other hams on this unit.

I am completely lost.

Are there any books for the complete dummy on how to understand freq,
repeaters etc. so that I have some place to start.

Any and all help is appreciated.

The screwdriver will give you superior performance every time. The whip is a non-resonant antenna with a tuner to match it to your radio. The screwdriver will yield much better results. I have measured as much as 25db improvement using a High Sierra HS-1500 over a steel whip and an SGC-230. I'm shure, however, that SGC's special whip would perform better than a CB whip.

Moved to Antenna Free subdivision in Fla 2 yrs ago and took up sailing in place of DXing. The complete station has been in storage since March '97 and is in PERFECT-NEW condition. It is as follows:

All Below New Dec 93

Kenwood TS950SDX w/CW filter
" SP 950 Matching Speaker
" IF232C Computer Interface
MFJ 989 C 3kw Antenna Tuner

Total cost for above: $4,699.00 Will sell for $3,350.00

Ameritron AL-1500 3kw Amp New Dec '95 Cost $2,450.00 Will sell for $1,800.00

Kenwood TM3530A 2 meter Xceiver (has a few small scratches) I don't remember what it cost me Will sell for $190.00

Mirage B2516 160w 2 meter Amp New Dec '96 Cost $249.00 Will sell for $180.00

Timewave DSP9 noise eliminator New July '96 Cost $189.00 Will sell for $99.00

Kantronics Kam Plus New Dec. '95 Cost $349.99 Will sell for $250.00

Astron RS-20M 12v/20a Supply Cost $120.00 Will sell for $80.00

ANTENNAS:

Heights 80' Aluminum, Free Standing, Motorized Crank Up Tower

This is an extreme duty tower rated at 23 sq' windload @ 80' @ 80mph without guys. It is in two sections. The bottom is 48' high and the top which telescopes into the bottom is 32' high. (cranked down height is 50') All hardware is stainless steel as well as the 3/8" winch cable. It can be seen at http://members.aol.com/w4laq Original cost in '93 was $6,100 Will sell seperately for $2,400 (including 12' of thick wall stainless steel mast and thrust bearing) It is broken down into 10 lengths of 8' and is stored indoors in Pensacola, Florida (along with all the hardware)

KLM KT34XA Tri Band Beam

I bought this beam in '95 to replace a PRO 67B and to give me more punch. It is also being stored partially assembled indoors in Pensacola, Fl. Original cost $640.00 Will sell seperately for $400.00

NOBODY will shove you out of a pileup or off of a frequency with this station!! I put it on the air Dec 19, 1993, and on March 27, 1995 received my Five Band DXCC plaque #3837 From Dec 93 til March '97 I worked 306 countries (all bands), 267 on 40m (I sold the 40m beam last year), and 226 on 80m (Using a five element half wave sloper array which I sold in '97) No exageration...The certificates are on the wall.

TAKE IT ALL FOR $8,000.00

This VTVM has a good case, all tubes, switches, resistors, etc.
internally. Good meter. Unit works but the plastic face of the meter
is broken. No manual or probe.

Will take $5 plus shipping which is $6.50

Marv

5476. Re: Need help learning

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-02 00:00:00 UTC
From: tbdinc@earthlink.net
Message-ID: <3755B16C.C71@earthlink.net>
Source record: 106816

<john sez>
I am interested in learning about HAM radio.
<end john sez>

Howdy, John. May I suggest you first visit the www site for the ARRL (American Radio Relay League) at: www.arrl.org Lots of fine information there for new folks like yourself.

<john sez>
I am not going to transmit but only listen.
<end>

Jolly good idea. The FCC takes a very dim, and very serious view against folks tranmitting sans license. Well, they can get rather testy.

But then you wanted to know the fun part. Please read on...

<more john questions>
"I am completely lost."

"Are there any books for the complete dummy on how to understand freq, repeaters etc. so that I have some place to start."
<end questions>

Indeed there are. Any Amateur Radio store (Yellow pages), and the ARRL webpage, will have manuals detailing start up; how to's and answers to just about any questions you might have. An added plus in stores are the sales people. Almost all are "Hams" themselves and happy to assist new people.

Ask about classes at the store. Usually the time is not demanding and fees are quite reasonable. Some folks find "study buddies" at these and that makes lessons even more fun and is an easy way to learn.

Try spoting a ham in a car, or truck. Look at license plates, check for antennas on the vehicle. Stop them for a chat. Tell the ham you're seeking information about the hobby...the problem won't be; "Gosh, I hope I'm not keeping you." Most likely you'll be the one crying Uncle. We do like to talk about our "Ham Radio Hobby."

Still more, John. Look in those same yellow pages for "amateur radio" clubs (should be one near you) Call them and ask about the next meeting, then go to it. A great way to meet others of all vintages in the hobby.

The newsgroups you've already found. Plus, there are the new generation websites like www.qth.com/ or for vintage equipment enthusiasts, try www.hallicrafters.org/ And many, many more.

The problem as I see it isn't where to start, rather it's where do I stop.

I bid you welcome, John.

Reply if I may be of further assistance.

Best regards,

Howard

PS: your first bit of info: "Best regards" in morse is equal to the number 73. It's either spoken as "Seventy-three," or tapped on a telegraph key using Morse code. Either way it means the same, "Best regards.

Want to buy, beg, borrow, rent, or steal, (or trade for?)
one test probe for my HP-8514A Vector Impedance Meter.
Have lots of amateur radio gear for trade, some amateur
radio related test equipment. Will consider letting you
use the meter in exchange for letting me borrow your
test probe. I need it for a "one-shot" deal. I need to
take ONE measurement to set a capacitor in a tuned circuit,
then will not likely need it again for years. Anyone have
a probe they're willing to share/sell/donate/etc.?

Thanks, -Web Williams in Myrtle Beach, SC

5485. Motorola Maxtrac PL to COR

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-02 00:00:00 UTC
From: Jeff Scoville <scoville@sprynet.com>
Message-ID: <7j4k2aglq1@nntp2.atl.mindspring.net>
Source record: 106825

We're currently using a UHF Motorola Maxtrac as our receive radio on an amateur radio repeater. In the past, we pulled the signal that goes to the front led (busy light) for a COR on our repeater controller. Now we'd like to go to a PL on the input, but have run into one snag.

When we program a PL into the radio, the front busy light still turns on for any signal, regardless of PL or no PL. I'm assuming that the radios were designed to do this so that multiple users with different PLs wouldn't key up on each other. The only difference is that non-PL signals have no audio. So, our repeater keys up, just no audio! Is there a different location on the Maxtracs that we can pull COR for signals that are strictly the programmed PL?

Thanks,
Jeff Scoville KC5RTH

5486. IC-745 as-is

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-02 00:00:00 UTC
From: Marc Robins <marc29400@ez2.net>
Message-ID: <928371688.015.44@news.remarQ.com>
Source record: 106826

IC-745 in inoperative condition and being offered as a fixer-uper or parts radio.
It powers up but has no display indication or reception/transmit.
Exterior has no damage but paint is rough and inside is clean with all boards intact.
Standard filters. No accessories. No mike or manual.
$225 + shipping.

Paul,

The "panadapter" is a band-scope. It is a graphical representation of activity on a given band segment...useful for contests and for seeing quickly which bands are "dead." You can tell from the side and rear connections...if there are no connectors present, the adapter is not installed.

The connections for everything else is pretty straightforward. For observing transmit waveforms you just put it in line with your coax. For 2-tone wave form anaylysis you just wire up a mic connector. If using an amplifier, checking linearity is a little trickier. If you buy one I can photocopy my manual for you.

Tom, N2LDE

Hey Jeff,

Here's a circuit that I used to connect a uhf Maxtrac(link radio) to a uhf Desktrac Repeater(two Maxtracs) to link to a distant repeater. It actually works quite well.

Subject: Electric and Magnetic measures

If possible I like to know the exact meaning of the following
specifications:

The Electric and the Magnetic probes (to measure e.m. fields) have both
an AC Output range of a max
of 1 Volt p-p , and a DC Output range of 2 Volt max.

When it is said that the sensitivity of Electric probe it is of
-10dBm/(V/m) what are the values of electric field (in V/m) at
A distance 10 cm , 1 m , 2 m, 10 metre if ,for example , i always
read 100 millivolt in the AC and in the DC scale?

When it is said that the sensitivity of Magnetic probe it is of
-10dBm/mT (mT= milli Tesla?) what are the values of magnetic field (in
milliTesla or Gauss) at a distance 10 cm , 1 m , 2 m, 10 metre if
,for example , i always read 100 millivolt in the AC and in the DC
scale?

Thanks very much

Emidio

Hi Everyone,

With any luck I will soon obtain enough money to purchase a new HT. I am now considering the Yaesu VX-5r (favoriite at the moment), the ICOM IC-T81A, the Kenwood TH-D7A, or perhaps the Alinco DJ-G5T, or the DJ-V5T. I would really like to read some straightforward, not-too-technical reviews on these models, is there a website or current mag that would have any info. on these? If you personally have any specific info/opinions to share, then by all means, please do. Money does not come easily to me, and I would like to do a little research before shelling out $300-$400 on some equipment. Thanks in advance!

Paul

5499. Higher gain copper cactus???

Hi , I am building a dual-band copper cactus tonight:
http://www.geocities.com/Baja/4990/cjpole.htm
Thinking I could build a higher gain version for a base station
by using 1" copper tubing and approximately doubling all
measurements. Anyone ever try this?? Anyone think it will
work? Also, I know you are supposed to be able to adjust SWR
by moving the wire on the long extension, any procedures or
do you just wing it (I have a SWR meter to check)? If I don't get
any real negative feedback I may just try it an report the results.

Source record: 106642
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Greetings,

I wish to sell or swap my Yaesu FT-900AT. This radio is in excellent working and cosmetic condition, with only a small scratch in the lower right corner of the display to prevent my calling it "near mint". The scratch is not visible when the display is lit, and the set is otherwise free of flaws. The YSK-900 Separation Kit and MH-31 Microphone are included with the radio, along with the original manual (and I think I have the box, somewhere).

I have enjoyed using the FT-900, but have too many newer radios. :-) I am looking to sell the set outright, or would consider a trade of a clean R-390 or R-390A receiver and cash in exchange for the Yaesu.

My cash price is $750 shipped to the Lower 48 States; actual shipping charges apply elsewhere.

Please e-mail with questions, and thanks for reading my post.

73,

Tony N8SNC

Howdy! Got some items for sale, always looking to trade, too, especially for some 6 m SSB gear...

1. Standard C156a 2m HT. See a photo and specs at:
http://www.stdradio.com/hanheld.html#156
Good condition with manual and AA battery pack, $75 + 5 to ship USPS 3-day.

2. Baycom BP-2 Multimode modem. Photo and specs at:
http://www.tigertronics.com/bp2info.htm
With manual and packet cable for the above radio and I believe it will fit Radio Shack and
some Icom radios too. $30 + $5 to ship USPS

3. Toshiba 2000x 386 Laptop- B&W screen, 1 MB ram (expandable) 40 MB hd. Not a Cray, but
worked well for DOS packet and logging programs. With power supply.
$25 + $10 to ship (heavy)

4. Bearcat BC 140. 10 channel scanner (some were expandable to 16 channel) VHF lo/hi UHF.
Scanner only for $15 + $5 to ship 3-day priority. Have too many scanners!

Take some or all! Or let me know what you have to trade (think 6m SSB!) All items will be shipped upon receipt of money order the same day well packed...

You can read the review of the VX-5R from the May QST on the ARRL's Web site (http://www.arrl.org) but you have to be a member to get to it. It's also possible that your local Ham store may still have a copy of the May issue on the shelves.

In an earlier post there was information about the mailing lists for the VX-5R and the TR-81A. I've since subscribed to both lists. The information on onelist, where the lists are based, is impressive for the VX-5R, much more limited for the Icom. Haven't seen a lot for the others.

It's really not difficult to connect one of the comspec units to the TR7950. Kenwood provides all the connection points where the TU-79 is supposed to attach. A comspec board will be much easier to find than the TU-79.

Just solder the comspec board wires onto a SIP plug that mates to the jack on the 7950 and you're good to go.

To clarify: I guess what I was thinking is that I am assuming this is a 1/2 wavelength antenna (rough guess based on size) and that if I double the appropriate dimensions I could make it a full wavelength antenna with better performance. With this design I am confused as to what portions resonate on each band to check this with the appropriate calculations. The change to 1" tubing was only to give added rigidity to compensate for the extra length. By the way, I built it today (as in the plans) and it works great!! Now if I can just make it even better....

By doubling all your measurements you might have an antenna of the same gain but on half the freq. So if you started on 2 meters , your new antenna would probably work on 73 Mhz or so. If you are building a j pole, you can roughly double the gain by making a super j pole. This is done by adding a section to the long side through a matching coil which is often just a section of stiff copper wire bent back on itself and sort of circled around the pole. The short side would be 1/4 wave, the long side would be 3/4 wave, then the 1/4 wave matching circle, then a 5/8 wave section on top of that. The gain is reputedly 6 db but I doubt if its quite that high. You could also make a j beam for about 10 db gain. If you want more gain yet, you should be building a co linear type with stacked 5/8 wave sections.

>I guess what I was thinking is that I am assuming this is a
>1/2 wavelength antenna

I take that back. Perhaps it is active as a full wavelenth offset vertical dipole on 2M? 60.75" off the center conductor and 16.75" off the the shield for an approx wavelength of 77.5" which would be for 144.94mHz?? Also, if I am figuring this right then lowering the wire on the taller antena section should make it longer, and thus lower the resonating frequency? And it's resonating on 70cm because the 2m band is approx 3x the wavelength of the 70cm band? I should have started building antennas a long time ago-this is educational!!
Eric

I thought I had seen everything on the front page of my WSJ
with my morning tea and Bloomberg News on the teevee in
the background. This one really took the morning muffin however.
At worst Ham Radio got publicity to the degree that quite a
few chuckles were enjoyed by telecommunications businessmen
reading the article, suprised and amused that people are actually
using backwards obsolete morse code to communicate in 1999.
I am sure some now see ham radio like if seeing a blue-haired
old lady tooling down the interstate at 45MPH in a 25 year old
Chevy. At best, some may see it as a wake up call to drop code
so that yet more MEGABUCKS value RF spectrum does not go to
digital cellphones, wireless internet and new technologies.
After all, why should a bunch of WASP's who like to talk
trash on 75 meters SSB be granted spectrum in the 144 and 440
Mhz spectrum, that can support services worth BILLIONS in
revenue to telecommunications providers. (Think about it)

> know of MARS modifications?
>
> Thanks
> Mike, KD6RFJ

I own one and it's not a bad little radio. I think it could stand a little more receive audio, but that's my own opinion. The broadcast and SW is not good on the rubber duck, but on a decent antenna it does a great job. Performance on 2 meter and 440 is pretty decent. I have had a lot of compliments on the TX audio. I haven't worked any one on 6 meters yet, but others say the performance is pretty decent on 6.
It will go out of band easily by either removing a solder ball under the battery compartment or by using the free EVE programming software. Not 100% sure what you mean by alpha-numeric since I am not familiar with the 78, but you can assign names to the memory channels as well as little icons. For all that it does, it is an amazing little radio. The battery runs right around 60-70 bucks, and charges in 2 hours if you use the optional charging stand.

You may want to subscribe to the VX-5 mailing list at www.onelist.com
A lot of good info there about the radio. Likewise, there is an EVE mailing list there as well. You'll have to do a search for the lists once you are at the site, but you can subscribe to them either as a digest sent daily, or individual postings.

5522. Which antenna tuner EDX-2 or AT-180 best for long wire.....

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-03 00:00:00 UTC
From: Randy and Cara Randall <crrandal@seidata.com>
Message-ID: <37574040.99598EA4@seidata.com>
Source record: 106662

Hello. I have an Icom 706 and a Icom AT-180 automatic
antenna
tuner. I would like to operate at
times with a random length long wire (Field day , emergency
operation etc. Will the
Icom AT-180 get the job done or am I better off getting a
Alinco EDX-2 also? The
instructions I have are not clear on
this type of operation with the AT-180.

Thanks,
Randy KB8ASO

I'm trying to build a simple radio that will only receive FM signals of a typical radio station. I was wondering what kind of tuner should I use, and where I can find them. I am looking for a cheap tuner chip around $10-$15. This is the first time I am attempting to build any radio device. If you know of any good book I can take a look of will be great. Any help will be much appreciated.

Ok-I am determined to build rather than buy-recommended books or web
sites on this type of construction? Also, I gather from your post that
exceeding
1 wavelength does not produce any additional gain, but instead you use
mulitple
segments of a resonant length?
Thanks, Eric

For random wire antennas, you want to stay away from 1/2 wavelength.
There are several "magic numbers". 51 feet is one of them. I think
39 is another, and 83 is another. Somebody sat down, a long time ago,
and figured out how to best stay away from the 1/2 wavelength.
That's how they got these numbers.

Of course, you need to remember that you start counting from the
tuner.

Get a users manual if you don't have one. Is this a radio which you have used on CW before, and it worked, that now does not? If so my suggestion will not help. If however you've never had it work on CW read on.

There are two things that may not be intuitively obvious that you need to do to make the TS-440 transmit in CW:

1. You need to put the rig into the transmit mode, by either pushing the SEND button on the left side of the front panel, or by having the OFF / SEMI-VOX / FULL switch on top of the radio in any position besides OFF. Then when you close the key contacts it should transmit.

2. You have to have the CAR(ier level) turned up a bit. Maybe around 10 O' clock.

You really should try to get a copy of the manual. All this is explained.

The Bergen Amateur Radio Assn (BARA) is holding
its annual Spring Hamfest on Saturday June 5, 1999
at the Fairleigh Dickinson University in Teaneck NJ.
Located about 5 minutes west of the George Washington
bridge, this is one of the largest hamfests in the
tri-state area.
Located off Route 4 at River Rd (Fairleigh
Dickinson University) exit, in FDU's parking lot.

Hamfest opens at 8am for buyers. Sellers start arriving
at 6am.

VE Exams will be offered from 8am to 10am only, all classes.

Buyers donation is $5 each, XYL and Harmonics are free.

Sellers: $10 per space.
Limited electrical is available for $20 per space and requires advance
reservations.

Visit the BARA website for more details at
http://www.bara.org.
Or contact Jim Joyce, K2ZO at 201-664-6725 or
email Jim at jjjoyce@cybernex.net.
Talk-in on 146.19/79.

....Agree with the others on staying away from 1/2 wavelength on any band (this presents a (high) voltage feed point at your tuner...hard to handle and easy to get RF on everything (fingers 'n lips included!). Suggest 100 ft as being workable with a T-Match tuner (in my experience). If you're located on a second story or higher then I'd suggest NOT using the building ground but running as direct as possible (#10 is ok) ground wire down the building to a minimum 8 ft ground rod (lots of variables...soil conductivity etc). Remember if you are in that situation, YOU are in effect part way "up" your antenna system so always be wary of stray RF floating around but a good T-Match adjusted correctly will work fine. You mentioned being new so I'll toss a brief description of tuning the tuner. 1. Ensure VSWR meter is between your TX and the tuner input and that you have a dummy load switchable in place of the tuner for initial tune up and/or just VSWR calibration. Tune your transmitter into the dummy load per normal or if a no-tune TX merely calibrate your VSWR meter at this point and switch to reflected. 2. Listening to the part of the band you want to operate on, tune the tuner for maximum received signals - if a T-Match tuner, preset the capacitors to mid value and tune the inductor first, then the capacitors next (no order to those). A DEFINATE increase in received signal strength should be observed. 3. Transmit briefly while observing your reflected VSWR reading and quickly tune the capacitors for minimum VSWR...this ought to be able to be done in minimal time and should yield a sharp null in reflected voltage....switch to FORWARD to confirm you still show your calibration output.....OPERATE!

Just a note here....if you are using a tube type or transmitter with a LOADING control, after the last step above you may be able to provide a little further "trim" by observing FWD reading on the VSWR meter and touching up that LOADING control slightly for max FWD reading. Some transmitters (of this type) may be able to match loads of 40-100 ohms for example.....of course your VSWR meter is built for a specific line section impedance so don't go too far off with this idea....(like trying to hang that meter on the OUTPUT of the tuner!!!).

73 - Keep on Tinkering.....THAT.....is REAL HAM RADIO

Hi Randy,

You would be better off using the Icom AH-4 as a long wire tuner. The Alinco will work but it must be modified. The AH-4 worksright out of the box. If you want to feed and unballanced antenna you can build a unballanced adapter from an SO-239. Icom doesn't recomend it but I have bult one and it works just fine with reasonable antennas.

Nobody makes mention of the loaded section being attached to the
antennas or not. It HAS to be
The user manual is wrong. Slight loss in translation Japanese for "6m
and bellow" translates to "bellow 6m"!!!.
You definately need the extra loading section. If you transmit with out
it you WILL, not could but WILL fry your PA. If you haven't used it I
recomend checking your power output now, may be considerably lower.
I've got over 5km in the suburbs while riding around. Haven't checked
further.
Have a friend over 30km away but I live on a hill.
Cheers
Eric.

Source record: 106710

I have a Ten Tec OMNI VI+ and it is a great radio. I have all the ssb and cw filters, 961 power supply and microphone. It is really a great cw rig and works great qsk with my tentec amplifier. I am selling it for $2350 f you are interested.
The reason for sale is that I have an ICOM 775dsp which I like better for several reasons:
1. Monitor switch
2. Built in power supply
3. QSK is as good as Ten Tec.
4. Built in antenna tuner with memories for two antenna selections
5. Higher power output (200 Watts)
6. DSP about as good as tentec - Tentec has better dsp and very good filtering. I don't here much phase noise as they advertise, but the dsp in the icom is also good and seems to take out background noise well.
I would keep the tentec since it is very easy to use, lightening fast on cw and very lightweight for a 100 watt radio.
I have not head very good luck with Yaesu in my 35 years as a ham but that is me talking as I know of lots of people who swear by the FT1000 and the 1000-mp. I think the service on the ten tec is supurb and can easily be done by the user with board swap, but the Yeasu with all its surface mount circuitry and microsoldering is more prone to circuit board cracks in transit (dx peditions) that the tentec.
Hope that helps - I am in San Diego and did us ethe ten tec in the last CQww WPX cw contest with excellent results.

Bob, AK6R

What is the gain of a hose antenna?
J. Murray Neece wrote in message <37545D75.9C5D6F9B@iglobal.net>...
Tennadyne Antennas: TENNADYNE
For just $395 Delivered US you can get REAL GAIN on all 5 bands with this small log periodic...Check it out in your QST....I love mine and it only weighs 29 lbs. NO TRAPS..
Way under-advertised!! 73 Murray K5MDM WORKS LIKE A HOSE!!!
Sean Baxter wrote:

All:
Experience of installing and using Cushcraft's new MA5B, 5 band 3 element (2 driven) mini beam.

I ordered the antenna from HRO and to my surprise it arrived 2 days later from the VA store. Costs $300 US.

The antenna is well built, traps look to be heavy duty with stainless steel fasteners throughout. No missing parts. Instruction manual is easy to read and understandable assembly instructions. However, because of the X hat end of elements you need to have at least 2 saw horses to set the antenna on while you connect these X hats on to the end of the elements. Also, I would strongly recommend wearing safety classes with these X hat elements sticking up everywhere. When assembled the antenna looks like a porcupine. You can not put the antenna on the ground without bending these X hat elements. Care must be taken to align the X hats to 45 deg. to the boom while at the same time making sure the drain holes of the 6 traps are facing downward. Innovative design in that the only band to tune for (element length) is 20 meters. Took me 3 hours to assemble.

On air performance. I compared the MA5B to my trusted Caroline Windom coax fed wire antenna at 40 feet. The MA5B was installed at 35 feet.

20 meters, disappointing. Signal strength was never better than the C.W. At times signal was equal with the added help of some side lobe attenuation. Signals on the C.W. were stronger most of the time. Only on local stateside (high angle) signals did I see any front to back ratio (10 db on one signal). Lowest SWR I got was 1.5 to 1, and band width is only about 150 khz. Need antenna tuner to get full output at band edges. I will say that I tuned the element lenghts for 14.175 Khz per the manual and when installed the lowest SWR was at 14.190 khz.

17 meters, looks good. Signals on the beam was equal to as much as 2 S units (about 10 db) better than C.W. SWR 1 to 1. Beam nothing more than dipole on 17 meters. The Caroline Windom seems to degrade in performance on frequencies above 14 mhz and gets worse the higher in freq you go. Even though the beam is only a dipole on 17m, the signals were noticeably stronger because of this characteristic of my C.W.

15 meters, looking real good. MA5B was consistently 2 S units better than the C.W. I could see a front to back of about 10 db as well. SWR 1 to 1.

12 meters, looks good. Beam was about 6 db better than C.W. Beam only a dipole on 12 meters. SWR 1 to1.

10 meters, best yet. Beam uses 2 elements on 10m. About 2 S units betters than C.W. Good front to back. SWR 1 to 1 and almost covers entire 10m band with 2 to 1 SWR.

All in all I like the antenna. With my limited antenna mounting situation, this antenna helped my 10 through 17 meter signal strength performance.

Some Specifications:

Elements: (2) on 10m,15m & 20 m bands. (1) on 12m & 17m.
Gain (dBi): 10m-5.3, 12m-1.0, 15m-4.8, 17m-1.0, 20m-3.6
Boom Length: 7.3 feet (2.2m)
Turning Radius: 8.8 feet (2.7m)
Longest Element: 17.1 feet (5.2m)
Weight: 26.5 lbs. (12kg)

5552. RE FRS Resources and Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-03 00:00:00 UTC
From: Why@wam.umd.edu
Message-ID: <Why-0306990736480001@bay1-23.dial.umd.edu>
Source record: 106713

Thanks to those who posted information about these. Let me see if I can provide a bit more info here. I would like a small radio, easy to carry in car, or bag, to stay in touch with my son when we go bike riding, or to the beach, hiking, or camping (canoeing). I also would like to use the radio to stay in touch with my wife when we are in different cars going to these (above) types of outings, and other sundry everyday ocassions. We don't travel often to big amusement parks but I can see that being a possibility. I can also see them in use in a mall, or with other family members when in a park, etc. I especially value my son having a way to communicate with me.

Thus, I was thinking of FRS. They are simple and my wife and son need not worry about license or figuring out how to operate, transmit, etc. Are GMRS radios better for this kind of use I envision? Could I use a GMRS radio and give my wife and son FRS radios? That is, will I be able to trasmit with a GMRS radio and have other FRS radios pick up my transmissions? Can they transmit to me? I am a total newbie at this so please excuse the ignorance. How difficult, that is, how much hassle is it to get license for GMRS? I toyed with some FRS radios and they seemed pretty clear in transmission, are GMRS radios as clear or is there lots of noise and crackle and pop that comes through?

Thanks, any help would be greatly appreciated!

Nat

There are many web sites that list radio modes. A simple search should
give you a number of hits. Also try the Icom site. I think they post
modes for their radios.

This is an open forum Bucko, speaking for myself I appreciate it when
someone freely presents facts that may asist in me in making decisions.

Is the warranty card intact ? if so then $50 off and no tax is a pretty good
deal,

otherwise: you are charging over market and have been called on it, recouse
1: lower your price in order to make a sale, recourse 2: go to Ebay, you may
get about $1200 US for it.

I am going to disagree with the other posts.

IF you are running this as an end fed long wire, and are using the ground as 1/2 of your antenna, then you want to have the highest possible impeadance for your wire. This will result in several thousand volts at the tuner and the tuner end of the wire, so you need to make sure no people contact the wire, and it does not arc over and start a fire.

When you run an end fed wire against the ground, you are depending on ground conductivity to provide the "missing" half of your antenna. If the antenna impeadence is 10 ohms but the ground resistance is 1,000 ohms then only 10/1010 of your power goes in the air, the 990/1010 of your power is wasted in the ground. conversely if the antenna is 1,000,000 ohms and the ground is 1,000 ohms, most of your power will go into the air.

Amateur Morse Debate Makes Page 1 of Wall Street Journal

NEW YORK, NY, Jun 3, 1999--Hams checking the prestigious Wall Street Journal for the latest business news and stock quotes yesterday also found some Amateur Radio news--smack in the middle of page 1. A story by Staff Reporter Lee Gomes headlined "TO HAM OPERATORS, MORSE CODE TEST IS LIKE LATIN EXAM; Does It Keep the Barbarians At Bay, or Is It Fueling The Decline of a Culture?" discusses the current code versus no-code debate in Amateur Radio.

"Morse Code is a dying language in the Digital Age, but it's still required reading for amateur radio buffs," Gomes' story begins. His report outlines the broad strokes of the controversy and the impending FCC streamlining that is expected to address future Morse code requirements for amateurs. It also quotes the FCC's Bill Cross, W3TN, as "the FCC's lead staff person on the question," and reports that the FCC "is contemplating relaxing the Morse Code requirement."

Gomes cites Bruce Perens, K6BP, of No Code International, who--in Gomes words--considers Morse code "an antiquated technology" and "a turnoff for young people." "Perens is in the minority," Gomes asserts. "Most licensees don't want any change in the requirement--especially since they have already passed the test themselves.

Taking the opposite viewpoint in Gomes' article is Nancy Kott, WZ8C, of FISTS, which Gomes describes as a "militant pro-Morse group." Gomes says Kott "all but accuses the no-coders of taking bribes from ham

radio makers" and claims
they want the code requirements dropped to attract
more hams and sell more
equipment.

Gomes reports that FISTS members fear a lot of bad,
on-air behavior "without the
screening provided by the Morse Code requirement."
Perens, Gomes says, is not
concerned about a "post-Morse ham world inhabited by
barbarians." Perens points
out for the article that applicants still will have
to pass "rigorous tests" to get a
ticket. Besides, Gomes quotes Perens as saying, "The
riffraff have no reason to
leave the Internet."

The article does contain a few gaffes. At one point,
it refers to Morse code as "dits
and "duhs." It also incorrectly equates today's
International "radio" code with the
original Morse code devised by Morse and Vail some
155 years ago.

Gomes further suggests that all of the 2250 comments
the FCC has received in
response its Amateur Radio "streamlining" or
Biennial Review rulemaking
proposal came from hams concerned about changes to
the Morse code
requirements.

The complete article is available via the Web for a
fee to registered users of the
Wall Street Journal's interactive page, http://
www.wsj.com.

5558. ARRL Budget Cuts Sham ! Lobby Remodelling Underway

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-03 00:00:00 UTC
From: mf_luder@my-deja.com
Message-ID: <7j65uihjn1@nnrp1.deja.com>
Source record: 106719
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc,rec.radio.amateur.equipment

After inheriting 800,000 dollars from an estate last year, ARRL has decided to hide its past (antique gear from the lobby) to show that it never had anything to do with CW whatsoever.

The lobby, currently being remodeled comes amid blatant lies such as the need to raise QSL bureau rates for postage and cut W1AW code and operating hours.

The sham ? ARRL continues to hire contester friends of K1ZZ, three in the past year, through unadvertised job openings. Business isn't too bad if they could give Mr. Bee, et al, second careers in Oldington.

More spin from one of the most corrupt NPO's since the Red Cross and United Way scandals of the 90's..

I built one for 2m once upon a time (I think 1969) after a recipe of
Rothammel: Antennen (An east German author). It was a stacked
version with two planes. Though my technical possibilities were
very limited at that time I got it working reasonably well and
had som nice qsos up to 300 km in distance at good conditions.

If you can get along with my english I can translate for you
the crucial passages.

Ham spirit!

Best Regards
Gerhart

It's a high mu triode with 450 watts of plate dissipation. Should be
good for 1800 watts input in class C CW.

This was one of the Eimac series of triodes. I had them all at one time;
I either gave them away or they succumbed to gravity.

25T The suffix H or L indicates high or low mu amplification factor.
3C24
35T
75T
100T
250T
450T
1000T
2000T <-- now there was a big beautiful tube! I once saw a military
CW/RTTY transmitter with two of these bottles in it; it
loafed along at 10 KW.

The famous 304T was four 75Ts in the same glass envelope. They were
used as radar pulse modulators in WWII and sold on the surplus market
for 50 cents apiece new *until* someone found they had platinum grids
at which time they all disappeared.

Message-ID: <19990604011516.28518.00000278@ng-ff1.aol.com>
Source record: 106481

I am looking for some opinions on how well the Icom IC-W32A, IC-T2H, IC-2GXAT, Yeasu FT-50, and FT-51 HTs compare with regards to intermod rejection and how well (fast) they pass audio when using tone squelch. I have an intermod prone Yeasu VX5R that has the tone squelch delay problem and want to buy a new HT. I live in the Chicago area therefore I need the radio that has the best intermod rejection and (hopefully) almost no audio delay when using tone squelch. Any input on any of these radios would be greatly appreciated.

Please E-mail me directly.

Sincerely,

Dave D. studioded@aol.com

5573. Radio formulas - web calculators

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-04 00:00:00 UTC
From: Harry Lythall SM0VPO <harryvpo@hotmail.com>
Message-ID: <01beae50$762add90$8734d693@e0060b0eb282a>
Source record: 106484
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.shortwave,uk.radio.amateur,uk.rec.radio.cb

Hi again all,

I have waddled over to the HTML newsgroups and found the users there very helpfull. As a result I have managed to add the promissed radio formulas calculator (under BASIC INFORMATION) at:

http://sm0vpo.8m.com/ Main page
http://www.geocities.com/SiliconValley/3569/ Mirror in the USA
http://hem2.passagen.se/sm0vpo Mirror in Europe
http://members.xoom.com/sm0vpo Mirror in Far-East

So-far I have added calculators for:

Resistors in series /Caps in parallel (bit of a joke here?)
Resistors in parallel / Caps in series
Reactance of Capacitors
Reactance of Inductors
Calculating basic frequency - LC known
Calculating the number of turns on a coil - single layer
Calculating the number of turns on a coil - multi-layer
Evaluating a heatsink (what does this HS in my hand do?)
Calculating heatsinks (how big do I want to have it?)

Soon, I will be adding T/Pi resistive attenuators and VSWR calculators.
I will also be adding calculations involving sugar/SG and potential alcohol content plus boiling point as a measure of alcoholic content.

Best regards from Harry - SM0VPO
==========
PS
Windows is not the answer - it is the question.
The answer is NO!

Message-ID: <3757b971.31929635@news.mindspring.com>
Source record: 106494
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc.

Suppose I had a low power dual band HT, such as the ICOM IC-Q7, and I also had a single band VHF mobile, and I wanted to talk to a VHF station that was out of range of my little HT. Could I: Talk "cross-band" from UHF to VHF to my mobile tranceiver, (having the HT receive on the actual VHF frequency I wanted to talk on) and have the repeater offset on my mobile set to where it would receive on the frequency my HT was transmitting on, then re-transmit on the frequency of the station I wanted to talk to? Could I actually do this with the ICOM IC-Q7?

Thanks,
Paul

David, I see a couple LIDS trying to start a flame, so I'll answer your question. Your rig should only need abt 12 amps, but to be safe go for at least a 15 or 20 supply.

Greetings all,
I have a couple of things for sale or interesting trade:

Shure 102C carbon mike - condition is very good. Comes with original box, manual, mounting bracket and phono plug (not attached). I cannot vouch for the operation of the carbon element. $20 I'll ship to continental US.

56K v.90 data/fax/voice modem - PCI. I have the drivers for the data and fax side, but not for the speaker phone. It was used for about 1 month. $30 I'll ship to continental US.

If interested, please email me.

Hi Paul,

The answer to your question is no. You mobile radio is probably not capable of transmitting and receiving at the same time. Some mobiles can be modified to do this, but the problem lies in the fact that the transmit power would be coupled into the receiver circuitry. Instant toast. A filter capable of allowing your receiver to hear well but reject the transmit frequency on the same band is expensive and much of the cost of a repeater system.

It would be much cheaper to go out and buy a dual band mobile capable of cross band repeating.

Good Luck and keep inquiring!

From: "Christopher J. Galbraith" <cgalbraith@ibm.net>
Message-ID: <3757fbff@news3.us.ibm.net>
Source record: 106511

I just got a couple SP10s with no literature and I'm trying to figure out how to charge the batts while they're in the radios. I've been to the Motorola site and saw a reference to such a charger but I cannot figure out where it might plug in (the only connectors appear to be the speaker/mic on the side).

Currently I'm taking the batts out and charging in a standard charger, HTN9046.

Can anyone throw me some info on if and how the batts can be charged while in the radio? I'd like to buy a couple of these chargers or build some if I can get the pin-outs and correct voltages.

Also, if anyone is interested, I've got 4 or 5 spare desk chargers (HTN9046C) and a couple quick chargers/3 hr (HTN9026C) I could sell or trade for the ones I need.

Thanks gang! 73, Chris KA8WFC

get yourself a sma antenna with some gain to it, i believe i got the comet 17", which helps the rx/tx signal greatly. Before getting this antenna, i was getting a signal report of 2x5 with 5 watts, now getting a 5x5 report with the power dropped to 1.5 watts. A drop-in charger with an extra fnb41 battery would be nice too. Without the drop in charger, you have to recharge the battery while attached to the radio, so you can't charge one battery while using the other....

Enjoy...in my opinion, this is the BEST HT you can buy!

I recently came across a gadget that I can't use because I can't identify it. This thing is about 6 inches tall, and all black metal. On the "bottom" there are 4 numbered "N" connectors. On the side near the "top" there is a male brass Amphenol connector about .75" in diameter with 7 pins and a key. There are mounting flanges to mount this thing vertically, I would guess with the "N" connectors down.

There is a label on the side with the following information:

R.F. Coax Switch
MFR. No. 2831-51
Mod. No. 2LNRP1-1
Ser. No. 15983

28 volts DC
General Communications Co., Boston MA

Naturally, there is no company of that name in Boston any more.

I guess that this thing is either a double pole double throw coax relay with a 28 volt coil, or (more likely given 7 control pins) a 1 input and 3 output remote antenna switch. Perhaps U.S. military type?

Anyone who can give me any information about this beast would be most appreciated!

Thanks,

***dan

I was disappointed at the summary, where they stated that even if the morse requirements were dropped that there were still "rigorous testing requirments" to keep the rif raff out. This goes to the heart of it for me - if the tests went back to unpublished questions and answers, and you had to draw circuits again, I'd agree. As it is, that statement alone distorts the enitire balance of the controversy to the casual reader. "Never let the facts get in the way of a good story".

Folks, might I ask a favour? The WSJ
edition we get down here (satellited
to Orlando printer) didn't carry the
article at all! I can't get in from
the net since my library account runs
under LYNX, which is non-compliant w/
the WSJ site. Could someone pls xmit
the file to me? TNX.

I am in need of some information on reprograming the Maxon TP-4800 walkie talkie. I have some Maxon software but not that model. Could also use the external mike connector (I assume that it is where the programing is connected) and perhaps a manual. If anybody can help me I will pay any normal costs and/or trade some info or software. Please contact me by email. Thanks Don KB6GQA

Brian,
That's what I USED to want, and that's all I probably need, but dammit they just keep coming out with somthing a little smaller, or with more features, and I find myself getting convinced that I've got to have one. Believe me though, if I already had a FT-50RD, I wouldn't be looking at these now. It seems to me that the aluminum case of the VX-5R will get/show scratches, unlike the case on the FT-50RD.
Have you modified yours any? Did you have any trouble doing so? I know that there are several different "firmware" versions out now, some being a little different than others.

5619. IC-726 HF/50 Mhz Transceiver As Is

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-04 00:00:00 UTC
From: George Harrison <tradewin@flash.net>
Message-ID: <zmW53.365$sU6.349@news.flash.net>
Source record: 106530

IC-726 Transceiver as is:

Comes with SSB,FM,CW &AM ,direct digital synthesizer, 26 user-programmable
memory channels, 10 db preamp & 20 db attenuator, receiver coverage
500 khz.-30 mhz. and 50-54 Mhz.
Power requirements: 13.8 VDC

Receiver & display works but has a loose connection that
makes the display & audio cut out occasionally.
I haven't checked the transmit function and am not able to at present,
so will assume it doesn't work (it did work when last used, but no
guarantee).
This radio should require very little work and is a beauty to operate.

Exterior is very clean and has been in a non-smoking environment.
No interior modifications, single owner, never mishandled or operated
mobile.

Comes with DC power cable, handheld Icom HM-12 mike with up/down
frequency buttons while portable, manual and original box & packing
included.

Please make an offer.
George- WA1OMH

5620. Need info on IC-25A

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-04 00:00:00 UTC
From: No_Spam@No_Site.ca
Message-ID: <HuW53.93$u_2.397@198.235.216.4>
Source record: 106531

I recently had another Ham bring over an IC-25A that he is unable to change or store frequencies on. The unit is stuck on 146.01. The SIMP/DUP, NOR/REV, and OFFSET, buttons all work, so I have access to 5.41 and 6.61, but the main dial will not change frequency on the radio. I've figured out how to store the VFO frequency into the memory positions - I just can't get the dial to change frequency. VFO A and B will hold 6.61, 6.01 or 5.41 depending on what I was doing with the other buttons, and these are the frequencies I can transfer into memory.

Is there some kind of dial-lock key combination that has disabled the tuning knob? The guy has misplaced his manual, and I've never used an IC-25A before, so I don't know what combination might work. If anyone can tell me how to QSY with this thing, I'd appreciate it. I HOPE it's simply a locked dial, and not a CPU problem, bad dial sensor (an optocoupler, maybe?) or whatever.

I've done the extended Tx mod by removing the solder blob, a very easy job if you have the equipment for desoldering very small circuits. A friend of mine modified his with an exacto knife and it works fine, but i wouldn't recommend that to anyone..... The extended transmit and receive is excellent. I use this radio for work at the Sheriff's dept on the weekends, is very reliable and talks just as good as or better than our Motorola equipment. The dual band feature is nice since our EMS service uses UHF, and the Police, EOC, and Sheriff's dept all use VHF. It's a very good performer in all aspects. My particular radio won't allow for the extended RX for cell phones, but i'm not interested in that anyway...(but i had to check, ya know!) I did get a replacement antenna with some gain to it, seems to help LOTS. I can be at an accident scene 40 miles from the repeater and still hit it reliably on this HT (even out of band, on the commercial freqs we use), which our commercial equipment won't even touch. I've also got it set to do crossband repeat with my mobile - talks to truck on low power uhf, mobile retransmits to the repeater - works great.

Quite frankly, i'd be afraid of having anything smaller than this for the fear of losing it. Our game warden used to have one of those small Motorola HT's, but after misplacing it several times and finally losing it in the field, he's got a much larger and more noticeable radio now.

Now the guys at EMS are wanting me to order some of these for them and modify for business band for use at work....seems they're impressed too...

I'm told that Comet has a triband antenna that is better than the
stock antenna. Like you, I'm dubious that anything short will work
very well.

My LP is a KMA. It is fairly portable as beams go. You wouldn't
want to walk around a hamfest using it with a handheld, but it is
fine for going hilltopping. I use a telescoping fiberglass pole sold
at Home Depot for changing lightbulbs in high ceiling warehouses
as a portable mast. Since the mast is fiberglass, I can orient the
beam for vertical polarization to use it on FM. I normally use it
with the IC-706 in the truck, though, and use it horizontally polarized
for SSB.

I have a Cobra 148GTL-DX which I bought in the 80's. I've never used it mobile and it has had almost no use at all. I bought it as a collectors item at the time. It has been in the original box for years. It is not the one with the frequency display. It has am,fm,cw,ssb, 40 channels up and down and built in roger beep. It is in perfect condition and never modified.
Price: $165. shipped

I also have a Yaesu FT-757GX with the FP-757GX power supply. It is in excellent condition and also has never been mobile. No wears or scratches. I have the original boxes as well.
Price: $500. shipped.

I have not needed these pieces of equipment for a while now due to other interest and have decided to sell them.

Please email to mailto:catlink@erols.com
Thanks
Gary

I used to be interested in amateur radio,

until I relized that ham radio is just for Old men.

I would rather ride a skateboard!

5647. Anyone experience car electrical problems w/mobile installations?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-04 00:00:00 UTC
From: Mark Wunderman <markwunderman@sprintmail.com>
Message-ID: <3758BDD9.F07A3294@sprintmail.com>
Source record: 106558

I've got an ICOM 2700 dual band mobile installed in my Plymouth Colt (also known as a Mitsubishi Mirage, Eagle Summit). The radio is powered directly from the car battery, the antenna is a mag mount on the roof. After running with this unit for 3 years my car's computer failed (check engine light on, engine reved irregularly at idle, occasional difficulty starting car). The replacement part cost for the computer was $975 new or $750 rebuilt. I managed to get a used one for $200 which solved all of the automotive problems when installed in the vehicle. I have two questions.

1. Could my ham radio be responsible for the computer failure?

2. If so, what can I do to prevent a re-occurance short of not using the radio? (The computer appears to be completely enclosed in a 6 inch square metal box).

Any opinions, experiences, or suggestion would be appreciated.

Mark Wunderman

Hello,

I possess the interfacing for programmed the Motorola GM 300 and the program that go with.

The problem is himself that the software of want not to descend below 438 Mhzs!!!

How to make to can programs the TX on the HAM band.

That is necessary to you him to modify and how on the file gm300.mdf?

Would someone already have programmed this kind of station on strips hams?, and was one able to give me the file gm300 solely.mdf her would be cool.... :)) I am not very good in the HEX .

You must not be licensed, so here's some good news for you: There is now
a no-code Technician class license for V/UHF. No need to drop the code
for that spectrum -- it's already been dropped. Where you need the code
is for access to HF, and that spectrum is in no danger of being lost.

Yes the 2800H will do a cross band repeater operation, the same
remote control operation as the previous dual band radios but it does
not have V/V or U/U capability.

Frank, The first thing I woud do is is to clean the tube sockets. If the radio sat up that long, oxides form and the tubes most likly are not making contact. Next if the tubes are bad, post a wanted list on here and I am sure you will get all the help you need!

73's and good luck on the receiver

Hi Jim here KC2DHU.
I have a repair shop here and have run all kinds of radios in cars. I doubt verry mutch that the dual bander caused the computor failure. Of course if you are running 2000W then i could see some glitches pop up.
keep running the rig I'm sure it will be ok.

Use a multi-range meter on the ohms range, plus pencil and
paper, a little imagination, and a 24 to 28 VDC supply
via a limiting resistor, to find out everything you need to
know including the circuit diagram.

Assume the RF power handling rating to be the same as that
of the coax connectors.

Actually, it IS possible. I had a Chev Z24 for 7 years, and of those, I had
my FT5100 in the car for the last 3 years. The computer failed once a year
for those 3 years. Never had a computer failure until the installation of
the radio. Coincidence? Maybe, but I doubt it.
Your best bet is to make certain that you don't run any of the coax near the
computer or by the harness that the computer plugs into.

Hi Folks,

i m looking for a new hf rig, up to 30 mhz, maybe 50mhz, power input
for 12/13.8 VDC
.
for the time i look at the
alinco dx 70 th
kenwood ts 50s
yaesu ft 840 / ft 600
or icom ic-707

i think from the data sheets i like the alinco, all what i think i
need, all filters installed...

can anyone tell me about them, or give some information about other
rigs around them ?
what about extra filters, or what special functions should i look at ?

thanks for your help.
bernd.
aachen, germany.

> enitire balance of the controversy to the casual reader. "Never
> let the facts get in the way of a good story".The "rigorous testing" is not to 'keep' the riff-raff out, it is to
'get' people into the amatuer radio rank and file who have enough sense to properly operate their equipment within the confines of accountibility to the rules and regulations. People are not REALLY against the requirement of morecode examinations - they are REALLY against anything that resembles rules, regulations, work, etc. Let's properly name the culprit in this word slinging debate over the cw requirement for HF operating privledges. We are granted the privledge to operate based upon our ability which ma or may not be accurately verified by an examination. Whether one is pro or con on the cw issue we all need to remember the old slippery-slope argument - if - we deregulate cw, then what comes next? operating proceedures? basic electronic theory? I'm certainly not trying to flame the fires of endless debate but : "Serious amatuer radio enthusists should take a look at the entire picture before throwing in the towel on cw whether they like it or not". Just my 2cents worth of fodder for thought.

I've never had a mobile rig until recently when I acquired an Alinco DR-610T.
I have read that the optimum situation is to directly connect the power leads to
the battery. Is it possible, and functional, to pick up the required power from
direct connection to unused terminals on the fuse block? I really don't want the
hassle of routing it through the firewall if possible. I have a '91 S-10 Blazer.

Source record: 106587

Alan--I've had an IC-25A since 1982; checked the manual and I can't find any indication of the ability to "lock" the VFO. You may be correct regarding the rotary encoder. Don't think the Icom will be much help, but you may want to call Scott Malcom at 509-732-8883; he fixed my IC-211 a couple of years ago and is one of the "gurus" on old Icom equipment. Great work and very reasonable rates. Plus, he's always willing to talk on the phone and make suggestions to try before shipping radios off to him.

Good luck!

: Help...Thanks
: 73's and God Bless
: Joe Humberger KB9TFH...

One note:
I have (and like) a FT-50, but note that it has intermod problems in high rf environments-if not for the PL/DCS tone squelch, I'd have a rough time using it in certain parts of my area.
As for Serial #'s the ones that mod best are the ones with a 6 or less as the first digit.
All of the 7's I've seen have less capability, but they are still nice radios anyway.
As for CMT, even the 7's can get it-the '50 gets images 90.2 Mhz above AND below the actual frequency shown.

Problems to look out for:
Some series had a excessive power-off battery drain(not a MAJOR problem for most people, I suspect)-my unit has the problem, and I never bothered to get it fixed.
Yaesu DOES have a fix if you end up with a problem unit(2 resistors need to be changed on the circut board near the power button).

Hello. I'm interested in buying a Heil PRO-SET Headset/Mic. All I require is that it works 100%, it at least 70% cosmetically, comes with a HC-4 or HC-5 (or both), and comes with the adapter cables for Kenwood radios. Let me know if you have one for sale or know of one somewhere for sale. Thanks a lot.

Source record: 106598

Hello. Does anyone happen to have a copy of the Extended TX or
MARS/CAP mod for the IC-756 that they could e-mail to me? I have
found some copies of it on-line, but they are all zipped files. And since
all I have is a Macintosh, kind of hard to get at them. Also, does this
mod enable TX only .5-30 MHZ and 50-60 MHz or .5-60 MHz?
Thanks a lot for reading.

Let's see...you bought a VERY miniature HT. Now you want to add an external antenna, and an amplified speaker, and a mike - to make it a mobile rig.

<g>

I do not thnk you'll be pleased with the DJ-5T in your vehicle.

The speaker is not loud enough - you will need a speaker mike at minimum. And, of course, the battery life will be shortened at higher volume settings.

The DJ-5T - and its single-band cousins - are great for what they were designed for: low-power, shirt pocket ops. And for that, they perform quite will. I own all three, and personally would only use them while driving to monitor stronger stations.

But that's just my opinion - I could be wrong.

> Terry (KA5IHV)

I've done it both ways. Hooking to the battery usually gets you cleaner power.
Hooking to the fuse block usually lets some hash modulate onto the power
across the common impedance back to the battery. A good hash filter on
the power leads will often deal with this, and you might need a hash filter
anyway, so it isn't a really big deal.

I just installed a new radio in a new car during the past month, and I didn't think twice about running wire from the battery to the radio mounted in the trunk. It isn't that big a deal, and you are almost certainly guaranteed a cleaner signal in and out. I try to do things right, so I include a fuse on both sides near the battery and solder all connections. Guarantees that vibration and age won't affect the connections, and a short down the line will trip the breaker at the battery and avoid any problems.

How do you define "not working"? Many times the connection between the tube pins and the socket become corroded, especially if it's been stored for a while. If you remove and reinsert the tube a number of times, then the set might come back to life.

There are also many kind hams on this newsgroup that have some left over tubes tucked away where their spouses can't find them. Most would be glad to help someone out.

You can unscrew it from the end and then give it a thorough cleaning.
This requires a hot hair drier on the threaded area for a minute or so.
They use something like hot glue to seal the thread but it will come
off. Suggest replacing the element with a Heil while you are at it!!

We have <AGAIN> lowered the prices of all of Clay Whiffen's
remaining equipment including tranceivers and test
equipment.

The IC735 HF tranceiver is now $425. (Picture available)
The TriFuel electric start 8KW generator is now $1650.
Check out all of the TEST EQUIPMENT.
Everything else has lower prices too.
Please take a look at: http://celia.mehaffey.com/k3ix.htm

We have now sold about 2/3 of the items originally listed
and we SINCERELY appreciate the reception our efforts to
dispose of Clay Whiffen's ham radio equipment have received!

Thanks
Joe Mehaffey

Something happened working on antenna coax installing a new connector. Radio doesn't transmit with much power (only milliwatts) now! Don't have a clue what happened!

I can hear a clear, good sounding audio signal being transmitted if I monitor with another receiver close to the transmitter, cannot hit any repeaters however. The SWR-Power bridge shows no power out (2M). Using the same coax and antenna I can transmit fine with the HT.

Did the final go or is it something else? The radio acts like it's transmitting, just NO power. The final is a Toshiba S-AV17. If the final is bad, can it be bought somewhere other than Kenwood (big bucks)?

Thanks for your help,
Vic / KE4QJK

>What's the deal with the Kenwood TS830S gold & silver labels ???? I

Nothing at all. It is the color of the labels alone as far as I can
tell. The gold labels seem to have been a later run.

>am the original owner of serial #2041063--It was a very early unit--I
>purchased in Nov 81. It has a gold label, and the words HF TRANSCEIVER
>on the right lower corner. I've seen ones that say HF SSB TRANSCEIVER,
>and silver labels. Which ones are worth more ?????

Well, you might find someone willing to pay more for a cool label,
certainly you can make an argument if yours is a good one. Heck,
I may want to paint some labels gold and sell them now.

Source record: 106398
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Howdy Victor....although it could be other problems, the most likely one is your suspicion that the final is gone.....if you have the service manual and access to a wide bandwidth scope or VHF/UHF RF microvolt/millivolt meter you can check stage gains up to and past the final block.....that would just confirm. Not sure about the aftermarket supply though I do see adverts for some of 'em.....RF PARTS might be one company to try (QST listed I think and on internet).

5754. AZDEN PCS-7300H - need information

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-06 00:00:00 UTC
From: Les Wilson <nessman@servtech.com>
Message-ID: <375B0DE7.16A@servtech.com>
Source record: 106399

I'm looking for any information on the Azden PCS-7300H 440 MHz mobile radio. Please respond via e-mail to nessman@servtech.com since I don't have time to check the newsgroups.

- Any modifications?

- Does this radio do 12.5 KHz splits? I can't get it to do anything other than .05, .10, .15, .20. I need 12.5 KHz spacing for some monitoring.

- The DTMF microphone is making a crackling noise out of the little speaker element in the back of the mic where the DTMF tones are heard... it this a problem with the mic or the radio itself?

- How can I tell if the CTCSS decoding option is installed? I can program the tones, but when I close the squelch into the T.SQ mode, I can't hear anything.

- Speaking of CTCSS - the alternator whine in my car masks out the TX tones unless I'm at highway speeds (go figure). Of course, I'll have to get a noise filter on the wire to the battery... but can this be indicative of a problem with the radio?

- The seller didn't have the schematics for this radio - anyone have a copy?

- Service manual? Anyone?

So far, it's a nice little radio... the audio - TX and RX is clear as a bell. Bought it at the Rochester HamFest for $170 and it's a clean radio - used indoors all of its life.

I can't find any information on the radio anywhere on the internet.

Any information would be appreciated. Please e-mail me directly at nessman@servtech.com since I don't have much time to check the newsgroups on a regular basis.

Thanks and 73's!

Wayne,
What type of rig do you have?
Doesn't it have a connector for a linear amp relay in the back somewhere?
If it is a "modern" solid state rig you can modify the SB-200 to lower the keying voltage.....

I found some info on the new "video dual-bander" from ICOM it includes the elusive pamplet and some extra photos....

5762. Questions: 1/4 vs 5/8 wave antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-06 00:00:00 UTC
From: David Long <bison@homemail.com>
Message-ID: <375B489F.669CDEDB@homemail.com>
Source record: 106407

I am currently running a 1/4 wave antenna for my mobile operations (Yaesu FT-8500 dual band--although exclusively on the 2m band--using a mag-mount on top of the mini-van). I understand that I am not getting any gain from this setup. If I switched to a 5/8 wave antenna, I should expect 3 dB or so of gain.

1) What are the advantages or disadvantages of the 1/4 vs 5/8 wave?
2) What advantages can I expect by switching to a 5/8? (I can always keep my 19 inch antenna in the car in case I ever want to transmit on 440.)
3) What is "take-off angle" and what does it affect?

Thanks!
David
kd5fdw

A special thanks to the folks who came to Oklahoma City after the tornadoes. We appreciated the help!

5768. RF trips GFI circuit. Any cure?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-06 00:00:00 UTC
From: k7jy@aol.com
Message-ID: <19990605221421.07146.00000995@ng-ci1.aol.com>
Source record: 106439

Greetings all. I'm experiencing a problem with the GFI circuits in our new home. All's well when I run barefoot. I'm using an FT1000MP and a G5RV (one end is up in a tree at 100', the other is attached to the chimney on the house...abt. 45' high). No problems up to 100 watts output. When I fire up the SB 220 amplifier and start transmitting then the troubles begin. The upstairs GFI circuit trips, requiring a reset at the main GFI circuit switch. The station is grounded to a copper cold water pipe (this pipe is grounded...I checked with a meter....i.e. no pvc in the circuit). Due to the configuration of the house and property, I can't really move or raise the low side of the antenna on the house. Short of reducing the power out from the amplifier, is there a cure for this?? Your wisdom will be much appreciated. Many thanks and 73, de John, K7JY, Seattle.

5769. Re: Need info re type "N" adapter

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-06 00:00:00 UTC

Message-ID: <3759d90b.1480377@news.2xtreme.net>
Source record: 106440

I have a Vectronics that uses N connectors. I tried the Radio Shack adapters, but they didn't fit correcltly. I tried a local electronics parts supplier. They fit but didn't work (no center pin contact). I ended up making my own cables with N connectors and UHF connectors.

5770. FS/FT: Yaesu FT-900AT

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-06 00:00:00 UTC
From: tony@bright.net
Message-ID: <3759de7d.100848843@news.bright.net>
Source record: 106441
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Greetings,

I wish to sell or swap my Yaesu FT-900AT. This radio is in excellent working and cosmetic condition, with only a small scratch in the lower right corner of the display to prevent my calling it "near mint". The scratch is not visible when the display is lit, and the set is otherwise free of flaws. The YSK-900 Separation Kit and MH-31 Microphone are included with the radio, along with the original manual (and I think I have the box, somewhere).

I have enjoyed using the FT-900, but have too many newer radios. :-) I am looking to sell the set outright, or would consider a trade of a clean R-390 or R-390A receiver and cash in exchange for the Yaesu.

My cash price is $750 shipped to the Lower 48 States; actual shipping charges apply elsewhere.

Please e-mail with questions, and thanks for reading my post.

73,

Tony N8SNC

I can't quite see why GFCI RF hash isn't a problem, whatever
the line volts.
I have some pretty annoying QRN and the idea of it being
cause by one of those little buggers is worth looking at.

The Snowtown event must be getting at the VK5's. :-(

This typifies the trouble that can be caused by cross-posting to
several NGs. Mr. Tornado Alley shouldn't have included aus.radio
in his query, but Grumpy Barry could have provided a nicer example
of Aussie hospitality. (Don't blame the rest of the world for the
troubles you have, Barry; accept your lot in life and get on with
living.)

Make sure they are 50 ohm N's not 75 Ohms, they are different sizes like
the BNC's. You will damage the connector if you use the wrong plug.

5795. KENWOOD 830S GOLD & SILVER LABELS ?????

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-06 00:00:00 UTC
From: rong@computer.net
Message-ID: <375abc93.687346@news.computer.net>
Source record: 106466

What's the deal with the Kenwood TS830S gold & silver labels ???? I
am the original owner of serial #2041063--It was a very early unit--I
purchased in Nov 81. It has a gold label, and the words HF TRANSCEIVER
on the right lower corner. I've seen ones that say HF SSB TRANSCEIVER,
and silver labels. Which ones are worth more ?????

5796. FS: Yupiteru MVT-9000 No gaps

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-06 00:00:00 UTC
From: Robert <reinaga@cnmnetwork.com>
Message-ID: <Tez63.4412$D_5.99043@news2.giganews.com>
Source record: 106467
Cross-posted to: alt.radio.scanner,rec.radio.amateur.equipment,rec.radio.scanner

For sale this excellent scanner from Yupiteru which has Full coverage from
530KHz - 2039MHz.
overall condition of the radio is good. on the scale I give it 8.5 of 10.
8.5 due to the fact of small scratches on the radio. I am very picky
though, to you you may not even notice the small blemishes. Radio has Never
been dropped. For what I spent on it believe I would never want to.
this is not the M3 model
it is the 2 generation of the 9000 the one's which have the better
shielding.
included are the nicad batteries
carrying strap
original box
scanner of course
rubber antenna
any anything else that came with the radio but forgot of it
I will even throw in the ac adapter that I bought
and I will toss in a professional built data slicer also known as a hamcom
interface with jvfax/hamcom software that I purchased through the internet
from mfj enterprises

this is an excellent radio that is great but need the cash to drop in an
integra engine to my civic =)
and my local police went digital =(so what use is it now???

remember I am located in U.S. therefor no customs checks and no tax verses
if you were to buy it from out of the country.

this scanner is about 3 months old

I will take the best offer that I receive via email.
serious inquiries only please.

please visit pages below for more info or email me if you have any
questions.

5816. Need info on FT-8500

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-07 00:00:00 UTC
From: Vito Villamor <vovillamor@yahoo.com>
Message-ID: <375C0500.3C4AB06D@yahoo.com>
Source record: 106337

I just bought a used Yeasu FT-8500 this weekend. I installed
it and it works great. Everything works just as the user's
manual says, but I was hoping to get more information
about some of the undocumented "tricks" that it can do.
(I got the version with the DTMF-style microphone).

I searched to the web recently for information about the
FT-8500 but could not find any sites that even had a product
review of the radio. I know this radio has been discontiued
for some time now, but I'd really like to get more information
about the radio from sources other than Yeasu (I did find Yaesu's
page describing the FT-8500, but it was simply a list of features).

Thanks in advance for any responses,

---Vito

1 1/2 year old Icom Icom 756 HF and 6 meter transceiver. With internal
antenna tuner. Has the optional voice module installed.

MARS/CAP mods professionally done.

Unit is like new, with no scratches or damage. Functions 100% like new rig.
Complete with all paperwork, manuals, and original box.

Reason for selling, I do mostly AM activity on older boatanchor gear.
Located in Buffalo, NY, you can stop by for inspection if desired.

Will professionally pack and ship anywhere in the United States.

$1600.00 + UPS shipping to your postal code.

Image and specs of transceiver on the Icom site
http://www.icomamerica.com/amateur/hf/IC-756.html

Any questions just email.

Tnx

I don't have a solution other than learning to like QRP. However, I
have the same problem, except my threshold is more like 700 watts, and
ONLY on 7 MHz.

Source record: 106344

It all depends on what you want to work. Since there is little 6M repeater activity in your locale, you might want to go the SSB route. While 6M FM DX is quite possible, it is less popular than SSB (because of phase distortion on FM skywave signals, among other reasons). I am planning on building the Ten Tec 20 to 6 meter transverter this month, for use with my Ten Tec Scout. If you have the skills to build a moderately-difficult kit, I would recommend it over the MFJ wired/tested unit. You can get a wired and tested transverter from Ten Tec for $159, versus $95 for the kit. All reviews of both versions of the Ten Tec are very good to outstanding, for a lot less than the MFJ. Side by side, I have heard that the TT transverter beats the more expensive MFJ transceiver hands down. True, you need an HF radio to use the transverter, but if your HF rig is all mode, you can operate SSB *and* FM (as well as CW and AM), and in any event take full advantage of your HF rigs memories, filters, DSP, and other features. Have fun on the Magic Band!

Frank:

Here are a few sources for tubes. They are not nearly so expensive or hard to find as you might imagine. Hope you get the great old Drake working again, it is a terrific radio.

http://www.jorsm.com/~n9tew/tubes/tube-index.htm
http://www.agtannenbaum.com/
http://www.tubesandmore.com/
http://members.aol.com/etetubes/index.html

And for what it's worth, very soon the morse code testing requirement will be reduced drastically, then eliminated entirely from the requirements for a amateur radio operator's license. There is *already* a restricted license that requires no code knowledge whatsoever. Check out http://www.arrl.org for details.

P.S. I am just trying to help out, not trying to fan the flames of the code debate.

From: Will White <wcw@asu.uswest.net>
Message-ID: <375C39F9.B385A6E6@asu.uswest.net>
Source record: 106347

Terry:

The short answer is, yes. The reason a direct connection is desirable is to avoid overloading low current wiring, and to minimize interference and noise problems in the radio. Check the wiring diagram for your car and if possible use a terminal on the electircal terminal block that bypasses all the other wiring. Be sure you have a fuse in line, per Alinco installation instructions, and remember that if you use an unswitched terminal you have to manually turn the radio off, or else you'll run your battery down. Alternatively, routing two wires through an existing pass-through hole in the firewall is not usually that difficult at all, anyway.

Terry wrote:

Kurt,

You may try a search engine looking for "paint" or "hardware." Be warned however, that shipping aerosol spray cans overseas may be more of a hassle than it is worth. Have you tried Sears & Roebuck? I think they have retail branches in Europe. ALso, try to find a web site for the Rustoleum manufacturer. THey may be able to direct you to a retail source closer to you.

Wayne,

Check your installation thoroughly. Especially, make sure everything is tight. Add another ground wire from the radio chassis to the body of the car. Try wiring the radio directly to the battery, bypassing the fuse block. The RS noise filters are inadequate, especially the cheaper ones. You need to invest in a high quality hash/noise filter/choke. The last one I bought cost me about $15.00, and works fine, even in my '65 Chevy. I can't recommend a better source off hand, but maybe someone else will. Good luck.

I have for sale the following battery packs for the Yaesu FT-50 or FT-10/FT-40 HTs. They are all in excellent condition and are not scratched or beat-up. They have seen little use(charged/discharged maybe 10 times max). One battery, a Nickel Metal Hydride, is brand-new.

1. Yaesu FNB-41 Ni-Cd(9.6V/600 MaH) - $23 Shipped

2. Yaesu FNB-40 Ni-Cd(6V/650 MaH) - $23 Shipped

3. Yaesu FNB-49 Ni-Cd (6V/600 MaH) - $14 Shipped

4. W&W Manufacturing FNB-40M NiMH (6V/1000 MaH) - $30 Shipped. This one is Brand New, purchased in May, 1999 and Never used

I'll sell all the batteries as a package for $80 Shipped.

If interested, please contact me via email at sereikas@yahoo.com

5834. Eight-Year-Old Elmers Directory Needs Elmers!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-07 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <ibY63.29980$OL.718086@newscene.newscene.com>
Source record: 106355
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

As readers of the rec.radio.amateur.* newsgroups are probably aware, I maintain a periodic information posting known as the Amateur Radio Elmers Resource Directory (aka the "Elmers List") which provides a list of net Elmers, indexed by topic, and their E-mail addresses. (For users of threaded newsreaders, this article is linked to the base article of the Directory itself). You may also access the Directory at:

http://www.novia.net/~pschleck/elmers/

The Amateur Radio Elmers Resource Directory is 8 years old as of March of this year. In order to maintain its value to the net, I have strived to keep it accurate and up-to-date. In addition to reviewing the currency of the entire Directory every 2 years, I am constantly scouring the newsgroups for new Elmers to join the Directory.

There's always been an implicit invitation for any qualified person to join the Directory. However, since I've lost the half of the Elmers listed due to attrition from the last biannual mass-ack (i.e., no response at their last-known E-mail addresses; the 50% attrition rate seems to be fairly predictable based on the last few mass-acks in recent years), I felt the need to send out this explicit invitation. I'd like to replace the lost Elmers with new, motivated, quality Elmers from the net. Areas of expertise that are most desirable for the Directory right now include:

- Any expertise from residents of states, provinces, and foreign countries not currently represented
- Advanced homebrewing techniques (surface-mount, VLSI, DSP, spread-spectrum, etc.)
- TCP/IP Packet Radio and Gateways/Internetworking (particularly local IP coordinators and/or subnet managers/operators/leaders)
- Amateur Satellites/Space Operation (particularly Microsats, SAREX, and ARISS)
- Amateur-related Software for Unix/PC/Mac/Amiga/Psion/HP-95/PalmPilot
- College Clubs and organizational guidance/strategies
- Boy Scout Amateur Radio Merit Badge Counselors
- Unix/Linux/X-Windows programming and configuration
- Amateur Radio Organizational Contacts (I am especially looking for contacts for the ARRL Field Organization, GRAPES, AMSAT, QCWA, QRP Int., NARA(?), QRZ, CSVHFS, LAMBDA, ARES, RACES, FEMA, NACEC, any state OES or EMA, as well as any regional frequency coordinating body)
- Band, Mode or, Brand-specific equipment (actual manufacturer or dealer contacts would be quite welcome, as long as they reveal their affiliation and at least provide *some* free services)

- Maintainers of unique amateur-radio-related anonymous File Transfer Protocol (FTP) sites and World-Wide Web (WWW) Home Pages (as opposed to those that are substantially a rehash of, or pointers to, existing sites).
- Maintainers of unique amateur-radio-related mailing lists
- Editors/contacts for amateur-radio-related publications

Although expertise in any other area would, of course, be welcome also.

I'd like to emphasize that participation is totally voluntary, with very minimal obligations (1 or 2 polite inquiries a month, if feedback from existing Elmers is any indication). If you find that it is too much work, you are welcome to bow out, no questions asked. You don't even need access to netnews, just a reliable E-mail address.

If you'd like to volunteer, please go to the following Web-based registration form:

http://www.novia.net/~pschleck/elmers/register.html

I've got an old Canadian Marconi transmitter\receiver in good condition

with
headphones, wire antenna etc. Top half of this unit is the
receiver\transmitter,
and the lower half has a mostly empty storage area where speaker is
mounted in
back right hand corner. Just up from it is the cw key. The unit has a
canvas cover
with a snap on straps. Someone once told me this was used in a Lancaster

bomber. I'm looking for any additional info for this set. Approx value
would be
appreciated. There is a metal tag on front cover with some info.

Many of us were been using the Internet for years before MS-Windows could
even begin
to talk to the Internet using UNIX. Telnet, ftp, NFS, gopher, Archie and
hundreds of Internet apps were
online long before MS-Windows even knew what TCP/IP was! Remember that
Mosaic (Netscape)
was first written as an X-Window app!

5846. Turn your PC into a DSP!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-07 00:00:00 UTC
From: "Thomas F. Swezey" <swezeyt@winternet.com>
Message-ID: <375C7269.C902BFF0@winternet.com>
Source record: 106367

I am a professional software engineer and a long time short wave
listener.

I have developed a Windows program that allows you to filter audio in
real time.

Connect the "Line Out" on your short wave radio to the "Line In" on your
PC's sound card.

Use the Windows "Volume Control" program to assign inputs and outputs
and set levels.

The program takes the digitized audio, filters it and plays it out
through your PC's speakers!

No special hardware or modifications needed.

It does require a fast PC - 200 Mhz or better.

For more information and a free Shareware copy of the program visit my
web site:

http://www.winternet.com/~swezeyt/dsp.htm

Thanks a lot,
Tom Swezey

Who cares about what the military uses we are not the military
and by the way a few special forces still are taught it guess who?

Some people still collect and use old HF gear older than most of
us. Still sounds good on the bands so are they obsolete beyond
use? Get real and quit beating a dead horse issue. Remember and
respect your roots! After all without amateur radio opertors/developers
where would communications be today,so let us all enjoy the NOS... ok!

5851. Azden PCS-7300H - 440 mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-07 00:00:00 UTC
From: nessman1@my-deja.com
Message-ID: <7jfdnhcih1@nnrp1.deja.com>
Source record: 106412

I'm looking for any information on the Azden PCS-7300H 440 MHz mobile radio. Please respond via e-mail to nessman@servtech.com since I don't have time to check the newsgroups. Thanks!

- Any modifications?

- Does this radio do 12.5 KHz splits? I can't get it to do anything other than .05, .10, .15, .20. I need 12.5 KHz spacing for some monitoring.

- The DTMF microphone is making a crackling noise out of the little speaker element in the back of the mic where the DTMF tones are heard... it this a problem with the mic or the radio itself?

- How can I tell if the CTCSS decoding option is installed? I can program the tones, but when I close the squelch into the T.SQ mode, I can't hear anything.

- Speaking of CTCSS - the alternator whine in my car masks out the TX tones unless I'm at highway speeds (go figure). Of course, I'll have to get a noise filter on the wire to the battery... but can this be indicative of a problem with the radio?

- The seller didn't have the schematics for this radio - anyone have a copy?

- Service manual? Anyone?

So far, it's a nice little radio... the audio - TX and RX is clear as a bell. Bought it at the Rochester HamFest for $170 and it's a clean radio - used indoors all of its life.

I can't find any information on the radio anywhere on the internet.

Any information would be appreciated. Please e-mail me directly at nessman@servtech.com since I don't have much time to check the newsgroups on a regular basis.

Thanks and 73's!

5854. FS: new old stock Cornell-Dubilier paper-in-oil capacitors

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-07 00:00:00 UTC
From: dmwilliams@tande.com
Message-ID: <7jg15hiqh1@nnrp1.deja.com>
Source record: 106415
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi Everyone,

I have a box of new old stock Cornell-Dubilier paper-in-oil capacitors
for sale.
These are type DYR 6011G
(2) x .1 MFD 600VDC - 7NKO +/- 10%
Use as two .1 mfd's, one .05 mfd, or one .2 mfd.
They are the rectangular hermetically sealed metal case variety with 3
solder lugs.
They measure 1.75" by 1" by .75", not counting the lugs and mounting
ears. The
following addresses lead to photos:

http://www.geocities.com/Paris/1665/doug/cd1mfd1.jpg
http://www.geocities.com/Paris/1665/doug/cd1mfd2.jpg

The paperwork with the box gives a manufacturing date of November 1944,
and
states that the test voltage was 1000VDC. I have taken capacity
measurements on
the entire box, and they all measure within specification.
I am selling these for $4 apiece, or $6 apiece if you want exact
matching.
Please write if you have any questions or interest.

Thanks, Doug Williams

5855. PK-232 trouble

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-07 00:00:00 UTC
From: Fidel Leon <fleon@bcg.es>
Message-ID: <7jft9p$3l2$1@diana.bcn.ttd.net>
Source record: 106416

I own a PK-232MBX with the DSP plug-in, with an Icom 706 MK-I.

The unit receives OK, but it does not switch the PTT circuitry of my rig.

If I short-cut manually the PTT and the GND lines, even from the 1/5 straight-pin connector, the rig transmits, so I should discard cable faults. The connections theorically follow 100% the document you sent me some months ago.

With a multimeter, I see thee voltage between the lines is less that a volt. When the unit goes to TX, the voltage is about 12V.

When I connect everything to the rig, the voltage is about 11.5V in RX mode, and 12.5V in TX mode. It looks like the unit does not "ground" correctly the rig, because, as said, the rig switchs to TX when shortcutting the pins 4 and 5 manually.

Could anybody give me any advice? Thanks in advance! 73,

5856. Re: Questions: 1/4 vs 5/8 wave antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-07 00:00:00 UTC

Message-ID: <7jg4ls$91f$1@shell.ametro.net>
Source record: 106417

Just get a dual-band gain mobile antenna.. Larson
makes one with the motorola mount that looks like an
extended cellular phone antenna, but its 144/440 gain
about 33 inches in lenght and costs around 25 dollars.
Several companies make dual-band antennas. Diamond and
Cushcraft make exelent ones too. I have a Larson like
I mentioned earlier and it works very well, its pulling
in repeaters I previously could not get with my 1/4 wave
antenna.

David Long (bison@homemail.com) hath said:
: I am currently running a 1/4 wave antenna for my mobile operations
: (Yaesu FT-8500 dual band--although exclusively on the 2m band--using a
: mag-mount on top of the mini-van). I understand that I am not getting
: any gain from this setup. If I switched to a 5/8 wave antenna, I should
: expect 3 dB or so of gain.
:
: 1) What are the advantages or disadvantages of the 1/4 vs 5/8 wave?
: 2) What advantages can I expect by switching to a 5/8? (I can always
: keep my 19 inch antenna in the car in case I ever want to transmit on
: 440.)
: 3) What is "take-off angle" and what does it affect?
:
: Thanks!
: David
: kd5fdw
:
: A special thanks to the folks who came to Oklahoma City after the
: tornadoes. We appreciated the help!

Yes it does. The cable is a DB9 female to fit your Com port and ends in a 3.5mm stereo plug. Also included is an adapter to the 4 contact type connector used by the FT-50, VX-1 and VX-5 radios.

Hope that helps Dark

God No!! It is my job and my hobby. I love radio construction. Funny thing, I design and build a project, make a couple of prototypes to get it 100%, then it goes in a drawer with the rest and I start on the next project. I never seem to have the time to actualy get around to using my radio equipment, I am too hapy building it!

I think that without HAM's we would be exactly where we are now anyhow, out of need.
Instead of HAM's, some normal person would have invented what we have today.
Just like without Einstein, we would still have the nuclear bomb.

That might have been Bry's E-Bone Yard, not E-Bay.
Bry has a listing of prices vs. models that have been sold at various places.

I don't have the bookmark here at work, so E-mail me at n8ie@arrl.net and I

I have 2 for sale / both in good condition and working with all documents. These are fully solid state 80-10 meters-ssb/cw, 400hz narrow cw filter, scan microphone, 100 watts, digital readout , pll tuning, and size abt 3x9x11. Also comes with power cable and they run on 12vdc. Rig has noise blanker, squelch, rit-xit, speech processor, plus wwv. They will fit and run mobile if one so desires. They talk and hear quite well. They are low maintenance and all components are standard . These units are rare and it took me a long time to find them. Im am downsizing a bit here because of new 2nd job plus way too many ham projects going. $250.00 each-shipped/ firm--Thanks

I purchased this exceptional VHF/UHF/all-satellite radio in Spring 1999 and have had it out of box only to test. It looks and works as new--for all practical purposes is new--in all respects. Included are all original accessories, manual, TNC cable, and original packing, just as you'd get from the dealer. The 821H has 9600 baud plug-and-play, auto up/downlink frequency tracking, keyer/speech processor, etc.; for detailed specs see http://www.icomamerica.com/amateur/satellite/ and rave review in QST March, 1997. Why pay more than $1,400 to a dealer when you can have this one for $1,195 shipped. Selling only because superfluous to my needs. Tks es vy 73! Jan N0JR

Cross-posted to: rec.radio.amateur.equipment,rec.radio.scanner

For sale this excellent scanner from Yupiteru which has Full coverage from
530KHz - 2039MHz.
overall condition of the radio is good. on the scale I give it 8.5 of 10.
8.5 due to the fact of small scratches on the radio. I am very picky
though, to you the blemishes my not even be noticeable. Radio has Never
been dropped. For what I spent on it believe I would never want to. this is
not the M3 model
it is the 2 generation of the 9000 the one's which have the better
shielding. Not the M2 though. The one that is CE certified.
included are the nicad batteries
carrying strap
original box
scanner of course
rubber antenna
super smiley II antenna **Great for 400Mhz. like police but sucks for
800Mhz**
any anything else that came with the radio but forgot of it
I will even throw in the ac adapter that I bought
and I will toss in a professional built data slicer also known as a hamcom
interface with jvfax/hamcom software that I purchased through the internet
from mfj enterprises

this is an excellent radio that is great but need the cash to drop in an
integra engine to my civic =)
and my local police went digital =(so what use is it now???

remember I am located in U.S. therefor no customs checks and no tax verses
if you were to buy it from another country
this scanner is about 3 months old

I will take the best offer that I receive via email.
serious inquiries only please.

please visit pages below for more info or email me if you have any
questions.

If the GFI is in the circuit breaker box I would use a ferrite rod and
wind a common mode choke and place it at the load side of the GFI. The
other possible solution is to go to individual GFI outlets for each load
replacing the GFI in the breaker box.

Dan-

I have also heard a story of one of the auto companies recommending replacment of computers that could have been simply reset.

Energy from the radio could get into the CPU and be interpreted as an instruction. Just as in our home computers, an invalid machine instruction could send the CPU into an endless loop that would require re-initialization.

I have had my Canadian Basic (same as Tech) license since November 1998, and offer the following suggestions since I have just gone through what you are talking about.

Only buy a handheld if you plan to take it camping, and then only if you are sure that you can hit a repeater while in the mountains. Very few people monitor the simplex VHF frequencies and you'll never get a contact that way. Otherwise, save your money and get a good dual band mobile with 50 watts output (for about the same price). You can still run it in the house with a power supply or in a vehicle on 12 V. The fun of having a handheld around town lasts for about 1 month, then you wonder why you ever got one. Mine sits for days without being used. The mobiles have much better reception too, which is important if you are planning on working satellites. If you have a computer with a soundcard, you don't need a TNC now, since there are lots of programs, including TNC emulators, that will allow you to receive and transmit digitally via your radio. Just do a search on the web for packet radio and soundcards. A 2 m rig is good to keep in touch with other hams in your area, but most of your fun will be on HF. Don't worry too much about number of memories etc., since you'll likely only use one or two repeaters in your area anyways.

What I am doing now is studying to upgrade to a General class license, which involves 12 wpm morse code here in Canada. I think it is worth it since, having been bitten by the bug as well, I want to be able to use the other bands. You will soon tire of just being able to talk around town or on the road.

So persevere, go for the General class, and get a full featured HF rig, 'cause that is what you'll end up buying eventually anyways.

Good luck!

Calling all Heathkit fans who might have or had a
HD-15 Phone Patch. I have one as well and cannot
figure out for sure what goes where on the back.
I do not have a manual and don;t want to spend $20
on one for obvious reasons. I figured all of you
who may have hooked it up a few times may have
some insight. I need to know what goes where on
the terminal strip.
Marked: line

Good point Gary. It is very important to fuse both sides of the power cable near the battery in an automotive installation when going directly to the battery. The reason being is if for some reason the negative ground lead from the vehicle to the battery becomes open, the ground return for the entire car will now be through your radio power lead and the grounding point of your radio or coax. Drawing a couple of hundred amps of starting current is not healthy to said power leads or coax.

Most car manufacturers now provide installation guides for installing two way radio equipment in the vehicle so that it will not void the warranty or likely cause harm to the on board electronics.

I have one Yaesu FT51RH 5 watt HT, with the out of band rx/tx mod done (sorry no 800 mhz). Included with the package are (3) FNB 38 9.6v battery packs, original slow charger and stand, MH29 LCD display microphone, WW Associates rapid charging cup, (2) filtered cigarette lighter cords - one for dc only and one battery charger/eliminator, soft case, boxes and manual. All equipment is rated a 10 for functionality. The display mike gets a 7 out of 10 for cosmetics, because the letters have rubbed off the buttons. Asking $350.00 for everything, which includes ground shipping anywhere in the US.

Thanks and 73,
Chris M.

the sav17 has a habit of developing cracks in the ceramic.
usually in the trace that feeds b+ to final.
with care i have repaired these.
so if you can get the cover off look carefully for cracks.
to fix remove from set and heat carefully to 350f in a electric frypan.
creep up slowly on the temp so you dont crack it worse.
then solder a wire across the break.
fixed 50or so like this.

5916. Is there an FT-1000MP Replacement being Planned?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-08 00:00:00 UTC
From: Pete <Tracktac@Megamailer.com>
Message-ID: <375DAE37.38FA@Megamailer.com>
Source record: 106277

The MP is now a 5 year old design, and the DSP, although well executed, is dated. Yaesu usually comes out with new o=models of a radio every 5 years or so....

Sooooo.... I ask,

Has anyone heard any rumors as to when Yaesu will be coming out with a new version of the FT-1000MP? How much longer are they going to continue to sell the MP now?

Has anyone spoken to Yaesu?

To all who responded, THANKS!

With EMAIL help, some head scratching and VOM, the problem was
traced to the final APC transistor (bad solder joint). Naturally
it was not driving the final.

These news groups are very helpful because of those who respond!

5919. Re: FT-90 Mod HERE!!! short version

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-08 00:00:00 UTC
From: KA8ZGP <jim@futurevision.net>
Message-ID: <928892620.361.56@news.remarQ.com>
Source record: 106280

I just figured out the mod for the Yaesu FT-90. It will give you TX
130-180
MHz / 410-480 MHz.

1. Remove 4 screws from bottom of radio.
2. Remove R2156 (connected to pin# 21 on Q2021, the CPU HD6473337YTF16)
3. Replace cover and screws.
4. Perform a Master Reset (hold down DISP/SS, <| |>) and turn on power.

That's it!

Perform this Mod at your own risk.

73
Jim - KA8ZGP

See http://www.qsl.net/ka8zgp/ft90/ft90.html for more details

No, HAM's are too heady and think they run the world already.
I won't go reading any books and worshipping or giving any HAM's any glory or honour as their heads are already too damned big that they put the goodyear blimp to shame.

5934. FS VHF antennas...GOOD AND CHEAP!!!!!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-08 00:00:00 UTC
From: n8wwm@aol.com
Message-ID: <19990607203505.26257.00001309@ng-fm1.aol.com>
Source record: 106371

I custom build <1 at a time> some darn nice 2 meter antennas!

3 EL Yagi-30.00 These are all aluminum, gamma fed, nice looking and
working
yagis...The Jpole is all aluminum, goes together
in 2 shakes,
4 EL Yagi-37.00 and is 3/4 wavelength long. These are excellent antennas,

and have sold out at local fests and club
meetings each
5 EL Yagi- 43.00 time I bring 'em.

Jpole<3/4 wave length>-23.00

Each antenna comes with an instruction sheet and all hardware to have it up and running in minutes. The yagis have gamma rod assembled and attached to the driven element. The Jpoles come with pre-drilled set points for tuning at 3 points in the band.

I am not some web scammer, I just like building antennas. You can reach me by this email address, by my call book address, or by sending a note to my call sign at PO Box 2189 Schiller Park, Il 60176.
Chicago area hams may arrange for local pickup.
SHIPPING IS $8.50, regardless of antenna. I will ship 2 of any one for $11.00.

INCLUDE YOUR EMAIL ADDRESS IF YOU ORDER BY MAIL...Checks or Money order payable to Doug Adair only...this is not a big business...I am just having fun and helping new hams not GET RIPPED OFF!

Thanks guys...73 and CU on 6 METERS!!!!!!!!!!!!

> If the final is bad, can it be bought somewhere other than
> Kenwood (big bucks)?

Since I tend to think in the tube world, do you have metering on the final? If so is there high voltage. If there is high voltage is there plate current being drawn in transmit. If there is no B+ then it would be that power supply, if there is HV and no current that I would suspect the tube or your exciter/IPA. Of course if you are in the solid state world then all the above would apply, but you wouldn't have any metering to look at so nevermind!

Not to say I agree or disagree, but I do have to wonder: how many of us who want to go back to those days actually have
had a license long enough to have to draw circuits (late 70's), or even before the era of published questions (early
80's if you count the "Bash" books)

5946. car battery as power source

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-09 00:00:00 UTC
From: Mark Barker <mark.ba@far-out.demon.co.uk>
Message-ID: <CLe29BBL8tX3EwMR@far-out.demon.co.uk>
Source record: 106183

Although a car starting battery is is not origionally designed for any depth of discharge it can be economical initial purchase and possibly last as long as a deepcycle battery if treated well.

Apparantly it's the time it spends in discharged state that kills it, not the depth of discharge. Sulphation crystals and shedding whatever that is.

Anyone have practical experience of using a car battery to run 12V powered transceivers while in a temporary location?

Is it really true a car battery never recovers from a deep (say 50%) discharge?

Date: 1999-06-09 00:00:00 UTC
From: Rick Pemble <pemble@earthlink.net>
Message-ID: <7jmo4jpoa1@birch.prod.itd.earthlink.net>
Source record: 106185

From the QRZ site:

Remove the top and bottom covers and the detachable
face holder. Look at the p c board that is vertical behind
the front of the radio. There will be 2 small chip resistors
on the left side of the board. Carefully remove the one
with the number 0 . It will be the one closest to the left
near the grounding spring. You will probably have to scrape it off
with a pair of needle nose pliers. After you remove it
the TX should be VHF TX 136.995 - 173.995. RX should
be 118-174. UHF TX should be 410-469.995 RX should be
300-470.

I made the mod on mine and it works as advertised.

cheers

Wondering if its safe to buy a FT-100. I had one for about 3 days and had to return it. Shoartwave stations all over the 10m band and I was getting distorted transmit audio reports in the AM mode.

Last time I spoke with Yaesu they were aware of the problem but did not have a fix.

Ryan,

There's just one radio to buy IF you want to program it from the front keypad. The JT1000 is what I have been using on 70cm since the radio hit the market in '95. The radio has 16ch, Motorola specs list it as a 4 to 5 watt radio, and has a display that shows channel and pl/dpl. Also has full keypad and dtmf capabilities.

There are a some options that need to be programmed via the software, but once those are outta the way, then all you ever need to do is type in the freq. from the keypad. I'd recommend getting a Motorola dealer to program it for you the first time, unless you want to buy $600 worth of programming hardware and software.

Some folks may suggest a GP68, but with all the controversy over it, it may not be worth the hassle. Also, being an import radio, you may have trouble getting it serviced if the needs arises.

Follow this link to checkout the JT1000.

http://www.mot.com/LMPS/RPG/NA/portables/jt1000/index.html

You won't be disappointed, I promise! This radio talks in places that other '5watt ham toys' won't.

Actually Mr. Young, I'm opposed to internationally mandated code testing. Just go look up that
statement that the FCC made that says the treaty does not specify what speed you need to learn
the code at. You need to know the code, but not the speed at which it is sent. I gathered this information from http://www.arrl.org/news/restructuring/98-143/nprm.html.

A lot of us are using a Comet MH-510, but it's not a short antenna...almost
21" long, but blows away the stock antenna, especially on 6 meters.
I've heard some people are happy with one Diamond makes, but cannot recall
the model #.

5958. TS-850 Ant Tuner Mod?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-09 00:00:00 UTC
From: Steve <steve.w3sy@erols.com>
Message-ID: <7jn26c$cc2$1@autumn.news.rcn.net>
Source record: 106195

Does anyone have a mod to make the internal antenna tuner in a Kenwood TS-850 work on receive as well as transmit?

June 1994 QST, page 80, lists a similar mod for the TS-450. Can this be adapted to the 850?

Please email me at STEVE.W3SY@EROLS.COM if you have any ideas.

Also, why did Kenwood design a tuner that works only on transmit? The antenna needs to be matched for peak performance on receive too!

Thanks!

73,
Steve W3SY

5959. Heat sink question?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-09 00:00:00 UTC
From: Victor <ke4qjk@qsl.net>
Message-ID: <i5E73.1809$CG.60108@typ31b.nn.bcandid.com>
Source record: 106196
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Working on a dual-band mobile recently, I noticed a lot of aluminum used for the chassis and final heat sink. Here's the question: do more holes in a piece of aluminum work better to cool than no holes?

This radios final has a small fan cooled, horizontal ribbed heat sink. Would the heat sink work better if holes were drilled vertically through the fins (thus providing more SURFACE AREA for cooling)? There would be less aluminum heat sink but more aluminum exposed to cooling air, and this radio get HOT!

Also, inside the radio exist another aluminum heat sink, no ribs, which even at idle is HOT to the touch. No cooling air moves past this heat sink. Would drilled holes help or hurt in this situation?

I was wondering if anyone has successfully performed the extended receive (and/or freeband/mars/cap) mod on an ft50rd that has a serial number beginning with 8H? I'm assuming that it still works for later models. Most of the information I've read on the subject is a little dated. Please let me know, if anyone has had problems, I'd hate to ruin a perfectly good radio.
Thanks,
Joe

Source record: 106203

Hi,
811A (this is different from plain 811's) used in Collins 30L1 or so will not be substituted for 572B's. Maximum plate voltage of 811A' is 1500V at zero bias and 572B's are rated 2500V. The SB200 has a plate volt of 2400V, so cannot be used even if the filament volatge and the pinout is same. You can use Svetlana 572B's for SB200 without problem but you can still find good used USA made tubes for less than $30 or so in the internet rather easily. Good luck to you!

Hello group,

Please check the latest version of The TubeBug.

Now you'll find the complete manual of the National HRO 50 receiver online
for you to download in the boatanchor section of The TubeBug.
Within the next few weeks you'll also find the manuals of the Sommerkamp
FRdx
500, FTdx 500 , Siemens E 309b and several other online for you to download.

http://Come.to/TheTubeBug
http://www.knoware.nl/users/ecremers

Come and have fun,

Erwin Cremers

anyone see the adam-12 episode where malloy got shot? his radio mic
was smashed and the only way he could communicate was to 'key' the
radio on and off. he sent a bit of morse code, was cool.

morse code is pretty cool, you don't need a radio to use it.
a mirror and sunlight works too.

anyway, i thought i might throw this in. my repeater is
voice id heavy, i was asked to add more morse code id
in the mix by my friend. after this suggestion,
i made a few rotating bulletins with morse code followed
by a voice counterpart to assist a tech ham in getting some
copy practice right from my repeater. it appears to have
helped alot. upgrade in sight =]

My guess is that it is a device for switching in and out a phasing leg of coax for switching phasing (directions) of a pair of phased verticals. Check and see if there is continuity only between two center conductors with no power on. Then put power on and see if each of the two that were continuous are now switched to the two other connectors.

I have the following gear for sale. Purchased from a business that is no longer using it. Will consider offers starting at $200, shipping extra (Orange County, California).

2 HT90 (NHN6326A), Jun 83/Jan 85
1 HT440 (NHN6325A) Jun 84
2 Mobile Microphones (HMN1017A)
3 HT Desk Chargers (NLN7493A)
2 HT Holsters
1 Mobile Speaker
1 Desk Microphone (HMN1027A)
2 Mobile Radios Maxar 50 (one Model D24JAA6000A, other larger, can not read label)
1 Power Supply for Base Station (HPN1004A) 14.2vdc
2 Mobile Mounting Brackets (HLN4609A)
Mobile antenna and coax with mount

Currently the HTs are set (crystalled) for TX 466.450 and RX 461.450. Presumably the mobile units are the same.

>Miller

There's an explanation of the test methods and what the numbers
mean on the ARRL website under the expanded product review
section (Members only section). Excellent/fair/poor varies depending
on the sort of rig and the sort of service to which you will put it. What
might be poor in a multi-multi contester HF rig might be excellent for a
VHF FM rig, or vice versa.

I have, too.
Even on the RF lines -- I've been able to V E R Y carefully
bridge the crack with a suitably-sized piece of tinned wire.
But some models and/or production runs may have a
difficult-to-open bond/seal between the 'box lid' and the substrate.
YMMV.

And, if this is/was the problem, it is due to an overheat, differential
flexing between the substrate and the attached heatsink plate. Insure
this plate and the rig's heatsink mounting area ARE VERY CLEAN AND
SMOOTH before re/installing the pwr amp. Use a V E R Y small swipe
of 'heat grease' on the back of the pwr amp when mounting -- wipe it
down with a clean finger until you can just barely see it. Do NOT
apply it as you would a gasket sealer for an automotive water pump!!!

HF Antenna Tuner, very heavy duty

Click here for link ->
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=115299903

Antenna Tuner (Transmatch)

HF Antenna Tuner. Homebrew, but better than commercial quality. Built with broadcast transmitter parts. Vacuum variable caps, and large roller inductor. Unit is housed in black instrument case, about 19" wide and 12" in depth.
Range: Covers 160-10 meters, will match a very wide range of loads. Tuning is not limited to the amateur frequencies as inductor and caps are not fixed, continuously variable.

Features: Turns counters on both vacuum variable capacitors, using the tuning/loading mechanism of a T-368 transmitter. Roller inductor, also with turns counter, is operated by motor with gearbox, using front panel momentary contact switches. Indicator light shows motor operation. Tuner can be bypassed via relay using front panel switch. Indicator shows tuner in/out condition. Front panel Power meter shows both forward and reflected power using internal bridge unit. Meter range is adjustable using front panel mounted potentiometer. Unit runs off 110vac, and is supplied with 3-wire line cord. Front panel is low gloss black with white control lettering.

Construction: QRO away! RF connections are mounted on the rear bulkhead using SO-239 jacks. Builder of the unit claims power handing capability of 5000 watts, and looking at the construction of the unit, liberal use of heavy strapping and broadcast quality components, I believe it. This unit makes the MFJ, Palstar and Nye tuners look like QRP.

Use: Was used with my T-368 for over 1 year, working flawlessly. I have seen many antenna tuners, amateur, commercial and military, and none have the heavy-duty constitution of this unit.

Any questions, just email!

Tnx

5993. Ufer Grounds

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-09 00:00:00 UTC
From: bren.doreck@ac.COM
Message-ID: <8625678B.0062EA8C.00@amrhm1102.ac.com>
Source record: 106318

If I use the rebar in my slab as a Ufer, is that sufficient enough to act as a ground with low enough impedance to dissipate the energy of a lightning strike? Will that energy come back through the electrical service connection and into the house? Should there be rods driven out a distance from the house (8-10 ft)?

I plan to put a common entrance (bus) to the shack for all coax with gas discharge suppressors on each then connect that to the rebar with copper flashing 5-6 inches wide.

Any suggestions, comments, or suggested reference material (for someone who is not an electrical engineer) would be greatly appreciated.

Is there anyone out there who could make a copy of their Kenwood
950SDX schematic for me ??? I will gladly pay any duplicating &
postage costs involved. I just bought a used 950, and the schematic
evidently is not part of the instruction manual, but is separate. If
you have a scanner, you could scan it as a gif, and E-mail it to me if
it is easier to do that. Also, any operating tips ??? The instruction
manual is quite complex---maybe one of you have some good tips.

Thanks in advance,

RON....KA2IIA

Source record: 106328

Hello. I'm interested in buying a used Vectronics HFT-1500 tuner for HF. All I require is that it be at least 70% cosmetically and work 100%, come with the meter power cable, and the manual and/or box would be a very big plus. Let me know what you have and what you want for it. Thanks a lot for reading.

From the QRZ site at www.qrz.com , in the MODS section, you will find:
(for this mod, specifically: http://www.qrz.com/mods/tmv7a.txt)

From: [see original article]
Date: Sat, 31 Jan 1998 22:25:46, -0500
To: editor@qrz.com
Subject: Mars/Cap mod for Kenwood TM-V7A

Remove the top and bottom covers and the detachable
face holder. Look at the p c board that is vertical behind
the front of the radio. There will be 2 small chip resistors
on the left side of the board. Carefully remove the one
with the number 0 . It will be the one closest to the left
near the grounding spring. You will probably have to scrape it off
with a pair of needle nose pliers. After you remove it
the TX should be VHF TX 136.995 - 173.995. RX should
be 118-174. UHF TX should be 410-469.995 RX should be300-470.

Yes!!!

Nuclear X-rays and Prompt Gamma pulses create a very broadband Electromagnetic Pulse (EMP) that easily exceeds 50,000 volts per meter (50,000 times 80meters/2 (half wave) equals 4,000,000 million volts across your 80 meter dipole). By the way, that is 42 billion watts in 377 ohm atmosphere across your antenna!!!!

During the 50's when Above Ground Nuclear testing was being performed, the STARFISH event, 700 miles from Hawaii, turned off the power grid in Hawaii. That was in the days of Vacuum Tubes...what happens today in the solid state world?

Extensive studies and tests have been performed in this area...nuclear weapons x-ray and gamma radiation will kill your radio and most everything else.

The Icom 706 is clearly better , from a performance standpoint, but also from a construction standpoint.

I saw the FT-100 at Dayton and did not like all those pigtails protuberating at the back at all. The IC-706 is much better in that respect.

The only thing I did not like about the 706 is that cheap plastic power connector on the back, but all ham radios seem to have that sloppy type of connector nowadays. What happened to those nice power connectors that radios used to have?

Loek

Sure, a Ufer ground is a *preferred* ground under the NEC. There are some minimum requirements, however. There should be a minimum of 20 lineal feet of minimum half inch bonded rebar in the concrete. The concrete jacket should be a minimum of 2 inches thick, and in intimate contact with Earth.

Your slab likely meets all the requirements for a Ufer ground, with far more than 20 lineal feet of rebar in its mat. But the rebar may not be effectively bonded together unless that was a construction specification. If it is welded, then you're good to go. If it isn't, you may want to add some made electrodes (ground rods) to augment it.

Date: 1999-06-10 00:00:00 UTC
From: mikrounit@hughes.net
Message-ID: <375ff4b4.1551115@news.hughes.net>
Source record: 106139

Hello,

This is Mike, KQ6MU.
My plans have changed for the contest.
I was going to go up with a friend on a mountaintop, but
now I may be going ROVER in California.
I would like to get some pointers and hints on where to set up
my antennas for the following grids:

DM03, DM13, DM23, DM24, DM25, DM05, & DM15.

These are the order of which that I will be traveling through these
girds for this weekend's VHF QSO Party!!!
Maybe someone out there could give me good places, such
as a park or an empty lot\field, to set up my radios and antennas.
Please tell me what city to go in.
I don't think that we will be able to go on mountain peaks, but ridges
are ok too. 2 reasons: too much time to get to a mountaintop, plus
a Ford Escort is the vehicle that I will be in.

If you can help me, please E-mail me:

mikrounit@hughes.net

I would greatly appreciate it!!!
Thanks & 73,

Mike Green KQ6MU

- Take the battery and antenna off

- Remove the two knobs (they just pull off)

- Move the rubber covers on the DC input jack and mic/phone jack out of
the way, so you can see into the jacks

- Remove the black "nicad battery" sticker on the back of the radio

- You will see a slot in the rear of the radio under the sticker with
two pots and a trimcap on a PC board - don't touch them

- At the ends of this slot are two small screws - turn them several turns
counterclockwise, but not all the way out. Then push on the screws.
The keypad should pop out the front of the radio. Once the keypad
and its gasket are clear, remove the two screws completely.

- At this point the only thing holding the radio in the case is two
small tabs on the metal chassis down near the bottom of the radio
which fit into two notches on the plastic case. Holding the radio
facing you, press on the circuit board through the keypad hole
while spreading the lower rear part of the plastic case slightly with
your fingers. The lower part of the metal radio chassis should push
back and out.

- Slide the radio chassis and out of the case, clearing the knob shafts
and antenna jack.

Now you can replace the rubber PTT boot.

When reassembling the radio, it's best to pull the little rubber
transmit/receive indicator light pipe up out of the case. Then install
the chassis in the case without worrying about alignment of the light
pipe. When the chassis is seated properly, insert the light pipe from
outside the case - it will go to the right place on the circuit board.

Dave

I notice from the hunderd or so responses, it boils down to 2 types of reply:

1. "You can't use them like this, that's not what they are for, it says in blah-blah that...."

and 2. "I've been using one to power trolling boat motor/ radio transmitter equipment/ lawn mower/ elctric lighting for years with same battery."

Debate continues...

Radio is in good shape and is the 403 to 470 split.It presently has ham and commercial frequencies programmed in it.It transmits and receives well.I have been unable to have it programmed locally.The local shop does not have the latest software.I called motorola parts id and was told it would require version R03.03.00 or later to program it,after i gave them the model and serial number. the local shop does not want to buy the later version untill they have more than one radio to program. I am tired of fooling with it and it is for sale as is for $200.
Thanks Al

Subject: WHY MASS TNX BULLS?
Path: K1UGM!WG1I!N0RSE!KT0H!N7CLV!N7MMC!KA6EYH!W3IXR ...

From: KB0JKR@W0CFY.#NCKS.KS.USA.NA
To : BULTIN@ALLUS

Greetings to all, the name is Tim. I, like many packeteers, list bulletins
from the local BBS often. I have seen bulletins requesting for help all of
the time. Days or weeks later, I see a bulletin from the same station who
sent the help bulletin thanking all of those who sent them information.

I find this rather odd since someone took time to send the requested info.
Then, the needy station sends them (and all others who helped) one message.
"Thanks to everyone for your help," they say, and I do not doubt that they
sincerely mean it. Why do they not send a personal message to each person
who sent them a message? If a person took time to send you help, does that
person not deserve a bit of your time for a personal message of gratitude?

Have a wonderful week to all.

Hi, Alan ---

Pretty sure. At least that's what my tests have indicated. I called Kenwood and they confirmed. (I assume the person I got onthe phone knew what he was talking about....)

I'm going to test it again a different way, but so far more evidence suggests it works on xmit only.

Thanks and 73,
Stee

It's not the "Mike for sales" that bother me... it's all the damn "Bills"
... they just send those guys to you without your even wanting them... I'll
never name any kid of mine "Bill" ...

Well the news media has been spewing nothing but trash for quite a while now... there used to be a real difference between the "Enquirer" and the "WSJ", not any longer...

I really enjoy morse code, but the FCC could drop it as a requirement and I wouldn't care... All I know is when I took my novice exam 25 years ago, it was harder than the current "General" exam. Forget about the code... let's get the "Radio" back into the testing...

Date: 1999-06-10 00:00:00 UTC
From: Michel Morin <morinm@csdgs.qc.ca>
Message-ID: <N3E73.7719$U4.311788@carnaval.risq.qc.ca>
Source record: 106206

Please disregard my previous posting, I made an error in the filter model number.

I have a Kenwood YG-455C-1 500 hz CW filter that I don't need because I am not into CW. Got that inside a TS-450SAT I just bought. I would like to swap it for one of the following items:

Kenwood YK-88SN-1 SSB 1.8 khz filter
Kenwood SP-23 external speaker
Kenwood MC-60A desk microphone
Heil HM-10-5 desk microphone with HC-5 element.
DSP by Timewave or JPS. (negotiable of course).

Inquire by email if interested please.

73 de VE2CJW
Michel.

?Upgrading my satellite station and have the following Icom
radio equipment for sale that will be
the envy of any satellite or terrestrial VHF/UHF operators.
Will sell separately or consider offer
for the entire package:

IC-271H ï¿½ 100 watt all-mode 144-148 MHz transceiver with
internal power supply, manual, hand
mic, internal pre-amp, and very rare UX-14 computer control
unit installed. Good condition.
$650.00 OBO shipped CONUS.

IC-471H ï¿½ 75 watt all-mode 430-450 Mhz transceiver with
internal power supply, manual, hand
mic, original box, and very rare UX-14 computer control unit
installed. Very clean condition.
$750.00 OBO shipped CONUS.

IC-1271A with TV-1200 ï¿½ 10 watt all-mode 1240-1300 Mhz
transceiver with internal power
supply, manual, hand mic, original box, and very rare UX-14
computer control unit installed.
Also has installed the exceptionally hard to find TV-1200
television adapter for sending and
receiving amateur fast-scan television using any camcorder
or other video source. Exceptionally
clean condition. $1,100.00 OBO shipped CONUS.

CT-16 Satellite Interface Unit allows any one of the above
radios to control tuning of another to
keep satellite uplink and downlink frequencies
synchronized. Like new. $100.00 OBO shipped
CONUS.

IC-SM6 ï¿½ Deluxe Electret Desk Mic with built-in pre-amp.
Works with any of the above radios.
Very clean, with foam wind screen. $60.00 OBO shipped
CONUS.

> cool than no holes?

As a gross generality, yes. However, there is a practical limit. If you drilled so many holes in the unit, you could reduce the amount of metal that would conduct the heat aware from the transistor and therefore be worse off.

> This radios final has a small fan cooled, horizontal ribbed heat
> sink. Would the heat sink work better if holes were drilled
> vertically through the fins (thus providing more SURFACE AREA for
> cooling)? There would be less aluminum heat sink but more
> aluminum exposed to cooling air, and this radio get HOT!

If your radio is getting hot one or more of the following is happening:
- the output device is not efficient
- you have a bad antenna system
- there is a short in the radio somewhere
- you are applying too much voltage to the unit
- you are simply talking to much
- you have it mounted in an inappropriate location
- the fan in broken
- you are running it at a higher power than you need

> Also, inside the radio exist another aluminum heat sink, no ribs,
> which even at idle is HOT to the touch. No cooling air moves past
> this heat sink. Would drilled holes help or hurt in this
> situation?

Probably not. But I don't know that it would help it either. Most new radios are one big heatsink. If the heatsink is aluminum and unpainted, painting it black will get rid of more heat. Also, attaching a much larger heatsink to the unit will also cool it down.

All semiconductors fail when their die temperature gets too hot - not the case of the component. There is typically a couple of degrees of thermal resistance between the die and the mounting flange. In the case of most output devices, you can get the die well over 100C without any problems. So in other words, it isn't going to fail unless the plastic on the front starts to melt! I've heard of Icom mobiles that were left transmitting and got so hot they melted the front lens and burnt the

table they were sitting on - yet still worked.

I have never made a mod to my FT-50 but the PTT button broke off. I got one
from Yaesu right away but can anyone tell me how to take the darn radio
apart?

Kable Guy,

I believe the radio you're looking for is the Kenwood RZ-1. Good luck finding one, because they're (in my opinion) in rare quantities. Be prepared to pay a premium for the rig when you do find it...

Cheers,

Gary kb3cgq

I have a mint condition M-8000 V7.5 digital decoder, this unit decodes virtually all non-voice communications. Included are optional rack mount attachment, Scan Cat Pro to control the unit via computer and a mint CompuServe 15" SVGA monitor to see the decoding. Have all original boxes and manuals.
This combo would be about $1700-1800 new, I am asking $950 and I will split shipping anywhere in CONUS.
Thanks
Bruce

Thanks for reading. I hope someone can help us. My brother recently bought a Yaesu FT-1000MP HF rig and he's having a problem trying to calibrate the VFO display so that it's on the right frequency. If I set my VFO to 28.41500 he has to set his to 28.41505 for us to be on frequency with each other. I checked the tone on 10.000mhz and it matches there but can't seem to get it on freq on phone. Any help or suggestions would be greatly appreciated. Please email keith@toolcity.net if you have any comments or suggestions.

73 and good DX,
Keith Reynolds - n3uux

Greetings!
I am looking for an all-weather, "compact", versatile, rugged, and if possible, effective portable / base / mobile station setup. Your comments on any of the following gear selections would be greatly appreciated:

1. Icom 706MKIIG
1a. temperature controlled transmit oscillator
1b. voice synthesizer
1c. 350hz rtty/cw filter
1d. 1.9khz IF ssb filter
1e. 16' separation cable
1f. main unit / front panel mounting brackets
1g. hm77a DTMF mic (better dtmf mic? remote control?)
1h. mb72 carrying handle?
2. MFJ 934 combo tuner / artificial ground
3. MFJ 4225mv switching 22 amp power supply
4. Ameco k-4 brass straight key (for starters;)
5. battery / solar panel (help?)
6. random, j-pole, dipole, counterpoise wires
7. Pelican watertight case (better field op case??)
8. automotive "spout" type connectors for all power connections (?)

Thanks again

Source record: 106100

Hi All,
I wish to go SSB QRP/Portable, which radio is better and why ?
The whole kit and caboodle will have to fit in to a backpack.
Power source will be gel-cell, antenna will be Delta/Quad loop.
I would also like to create some sort of hard container. SGC
do a carry kit for the 2020 but it costs quite a few "Sov`s" (that`ll
confuse the stateside boys) so homemade is the way to go !
I will be operating on the Llyn Peninsula including the Snowdonia
National Park area, the weather is very VERY changeable so
moisture may be a problem.
Thanks in advance, Gary - G7TOK

Greetings!

I have a Yaesu FT-900AT HF base/mobile transceiver that I wish to trade for a laptop computer of comparable value ($700 to $900 range). The Yaesu is in excellent operating and physical condition, and will be accompanied by the YSK-900 Separation Kit and MH-31 Hand Microphone. I also have the original manual and, I think, the box. The FT-900AT features an outstanding general coverage receiver and has a very good AM filter alsong with the stock Sideband filter.

I have really enjoyed using the Yaesu, but I have several HF rigs and I need a laptop. Please let me know what you have available.

Thanks & 73,

Tony N8SNC

OK, this radio has been out for a few weeks now and yet I have yet to hear any real reviews regarding receive performance. (I just HATE intermod!!) I am eagarly waiting to buy one of these new radios yet, if it has poor receive performance, I'll just have to pass.

So if you are one of these new owners of this very small new dual band Yaesu mobile, please post a comment on how you like (or dislike) your new radio. --73's --Greg--N0FKI

From: Robert Lyons <boblyons@umich.edu>
Message-ID: <37614849.A6BC1EFE@umich.edu>
Source record: 106111

I recently bought a UPS at a hamfest. It's an APC BK400, a small unit rated at 400VA. It runs from a single 12V 7Ah gel cell, but I would sure like to (a) extend its battery life, and (b) use it to charge other batteries (gel cell, marine deep-cycle, etc).

APC has so far declined to answer my questions, so I'm hoping some wise soul on the net knows something about this unit. Does anyone know if I can parallel more batteries on it to extend its run time? whether I can use it to charge, say, a set of two or more 12V/7Ah gel cells? I suspect the answer lies in whether the charger circuit is current-limited.

Thanks for any help -

73 de Bob, KI8AB

6118. Re: Any Good Sources for Reviews on NEW model HT's?

As has been said ad infinitum, but apparently not sunk in with most
folks, it is not lawful to modify and use a ham tranceiver outside the ham
bands. Such a radio is not "type accepted" by the FCC.
If you have a legitimate need to communicate on bands outside the ham
bands, buy a radio which is type accepted for those bands. If you wanna
play Ricky Rescue or Johnny Law, use the right radio ! Generally speaking,
if you are authorized to use a public safety freq the agency in question
will probably give you a radio. If you're not, they'll probably give you
something else when they catch up to you......

From: nospam@I.hate.spam.com
Message-ID: <37616134.249478302@news.aa.net>
Source record: 106115

Has anyone with this radio had a problem like this: When keying up another radio(10mtr SSB) it will jump into transmit mode for a split second. Enought to kerchunk a repeater. I have over 4ft of clearance between the two antennas right now. 10mtr ant. is a 1/4 wave whip mounted top dead center of the cab of my truck, 2mtr antenna is a 5/8 wave magmount in the center of the pickup bed. Did have it on the cab but was trying to get enough distance between the two. Power output is 85W (IC706). Anyone experience this problem? Any fixes internal to the radio? Probably just have to get a highpass filter for it and put in line.

6126. HELP...Anyone know of this Motorola trick?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-11 00:00:00 UTC
From: "Tracy L. Brooks" <rescue@wilkes.net>
Message-ID: <7jrt6d$7d8$1@news3.infoave.net>
Source record: 106120

Greetings,

The rescue squad I am on has thrown around the idea of switching from the VHF band to UHF band, in order to have access to several local medical channels.

An all at once swap is not practical at this time so a more gradual transition is needed. We have talked about just installing another radio for the UHF channels.

But...here is the neat part (if there is such a thing). Someone said that they believe Motorola made a device so that you could control more than 1 radio with just 1 control head (hence 1 VHF and 1 UHF).

Has anyone heard of such a thing? I need it for a Syntor X9000 and Maratrac if it's possible.

Thanks!

How odd. A sheriff (deputy?) telling the world that he's breaking U.S.
communication laws. That doesn't speak very highly for your department.

6138. HT Antenna Recommendations

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-12 00:00:00 UTC
From: Nick Schaub <schaub@blue.weeg.uiowa.edu>
Message-ID: <Pine.A41.3.95.990612165629.70630A-100000@red.weeg.uiowa.edu>
Source record: 105982

Dear Group:

Can anyone suggest an alternate antenna for an IC-W32A? I am looking for increased 2m efficiency. I am looking at MFJ, Smith or Diamond telescoping antennas. I would like maximum gain on 2m. I would prefer an antenna that I can attach to the HT itself and that won't damage or fatigue the BNC connection.

Thank you,

Nick J. Schaub
email: nick-schaub@uiowa.edu

I think it depends on whether or not you are a MARS or CAP member.

New FT-50's won't mod for xmit outside the ham band AT ALL.

6141. Re: Is there an FT-1000MP Replacement being Planned?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-12 00:00:00 UTC
From: Bill Clarke <w2blc@bigfoot.com>
Message-ID: <7jupqm$em3$1@ash.prod.itd.earthlink.net>
Source record: 105985

Haven't heard any gossip - however, your time observation doesn't take into consideration the FT-1000 and D which have been production over ten years and neither of which have any DSP.

Makes me think they should have something on the drawing board. Just wouldn't want to be the first kid on the block with the new beta gear.

6148. Ignition Noise

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-12 00:00:00 UTC
From: Dave <arcom@laker.net>
Message-ID: <37630DE1.B51AEA1B@laker.net>
Source record: 105992

Has anyone used the JPS ANC-4 Noise Canceller
or similar unit in a mobile?
Mostly, I am interested in how well it
removes ignition static on the lower HF bands.

Dave

The Kenwood SM-230 adjustment tool is 2-3/16" long and has a 2mm wide flat screwdriver blade on one end and a 3mm wide X 2mm thick blade on the other end. They are still available for purchase from Pacific Coast Parts, (800) 421-5080, www.pacparts.com, for $0.26. Part number was #W01-0406-14 but has changed to #W01-0406-04.

Whew, there for a minute I thought you might have been addressing your
post to me, I was almost ready to tell you to f*ck off. First of all,
no one asked you for any legal advice. There always will be an
abundance of "laws" here in the US with more added every year.
Brian has a good use for his radio, and if there is law against that
then it is the law that needs changing. I hope the amateur radio
community continues to experiment with RF communications, including
modification of equipment, as this leads to innovation and
technological progress, as well as scientific discovery.

What I have to swap:

A. 1 of Evergreen 200Mhz Pentium chip with fan (used briefly)
B. 1 of Microsoft Office 97 Professional Edition SR-1 CD and Key (unregistered; no hard copy books)
C. 1 of Western Digital Caviar 33200 3.2 Gig IDE Hard Drive (used)
D. 1 of Seagate Medalist 4321 (ST34321A) 4 Gig IDE Hard Drive (used)
E. 2 of Seagate Medalist (ST32122A) 2.1 Gig IDE Hard Drive (used)
F. 1 of Western Digital Caviar 12100 2.1 Gig IDE Hard Drive (used)
G. 1 of Panasonic 3.5" 1.44Meg Floppy Diskette Drive (used)
H. 1 of Toshiba IDE CD-ROM Drive XM-5702B (used)
I. 3 of 3COM 3C509B-TPO ISA Etherlink III adapters (used)
J. 1 of STB Systems S3 Trio32 PCI video adapter (used)
K. 1 of Microsoft Bookshelf 98 CD for Win 95/NT
L. 1 of Microsoft Expedia Streets98 CD for Win 95/NT/CE
M. 1 of Mitsumi IDE CD-ROM Drive CRMC-FX400D Quad Speed (used)
N. 3 of Intel Pentium 75MHz cpu chip with heatsink (used)
O. 1 of Quantum Fireball ST (ST16A2F1) 1.6 Gig IDE Hard Drive (used)
P. 1 of STB Systems S3 Trio64V+ PCI video adapter (used)
Q. 1 of Epson SMD-1300 3.5" 1.44Meg Floppy Diskette Drive (used)
R. 1 of Western Digital Caviar 2850 853.6Meg Hard Drive (used)

S. Outbacker Outreach 160-10 antenna with Outpost tripod (used briefly, excellent condition) $300 cash firm.

Mix and match any of the items listed above for fair exchange for mix and match items below or I'll take fair offers of cash.

Things I want:

AA. Good condition: Portable or mobile HF Rig with 160-10, QRP or 50 or 100Watts, Preferred Modes: AM,SSB,CW,FM,FSK
BB. Good condition: multimode tnc or packet/APRS tnc
CC. Good condition: GPS which may interface to TNC or PC
DD. Good condition: 144/440 MHZ fm handheld with programmable ctcss (FT-530D, HTX-204, etc)
EE. Good conditon: Digital camera 640x480 high res
FF. Good conditon: Parallel Zip drive
GG. Good condition: CD-RW drive
HH. Good condition: 144Mhz SSB/CW transceiver or all mode preferrably with ctcss
II. Good condition: 50MHz SSB/CW transceiver or all mode preferrably with ctcss

JJ. Good condition: 220MHz FM transceiver with ctcss
KK. Good conditon: mobile or portable antennas for above radios/freqs
LL. Good conditon: Antenna analyzer
MM. Good conditon: Legal Limit antenna tuner
NN. Good conditon: Marine band radio

Hi, Monte --

This is just my opinion, but you might want to steer clear of the TS950S and TS950SD. That rig lasted only a YEAR or so before Kenwood scrapped it in favor of the SDX. The SDX, per the QST review at least, is a WHOLE DIFFERENT RADIO. The sub receiver was fixed, a noisy synthesizer was fixed, the DSP was fixed, the lousy CW breakin was fixed, etc etc etc... If you are an ARRL member, you really should read the reviews of the SD and the SDX in the QST product review archives before you buy.

I'm not saying you couldn't have a lot of fun with that radio, but you could probably do better for that amount of money, OR look to spend a few more bux and spring for the SDX, which really is a good rig.

73,
Steve

I believe that the comments below concerning the TS950SD are correct. Kenwood pretty much scrapped the radio after a short time and then thoroughly redesigned it to be the TS 950SDX, which is an entirely different radio (and a remarkably better one). I have worked several TS950SD owners, and they were all having problems with the radio. RJB.

TenTec has no distributors. They do have a free 30 day trial if you want to give one a try. The scout has no bandswitch and uses plug in modules to change bands. Generally performance is good, especially the strong audio and smooth break-in but it does tend to jump about 20hz when sending cw. TenTec recommends you pause in your sending for a few seconds every minute or so to prevent the frequency jumping. They haven't been able to fix the problem since day one. If not for that problem, I'de have one myself. The problem is not as bad for slow speed work. 73

I'm looking for a copy of the manual for a Yaesu FT-290, first version. If no copies are available could someone tell me the procedure for setting the offset for repeater operation?

It is a pretty neat old radio and I would like to get it on the air again.

I have owned both. The receivers are very close to each other in overload
and noise related issues. The filter selection on the 1000MP is much more
flexible and easier to use.
The DSP on the 1000MP is more flexible
The read out on the 775 is clearer than the cluttered 1000MP front panel.
Both radios are on the top of the heap and it really boils down to the
features that are important to you.
If receiver properties are important to you then add the Kachina 505DSP to
your short list. It is better than either the 775 or 1000MP. It has extremly
low phase noise.

6178. Some notes on a "modded" FT-50RD

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-12 00:00:00 UTC
From: KP <kevski@hotmail.com>
Message-ID: <GKw83.476$1a1.39813@elnws01>
Source record: 106063

Hi all,

Thought I would share my recent FT-50 experience with the group hoping it will help someone out..

I recently traded some equipment for a used FT-50RD ser # 7N24xxxx, when I received it I couldnt get the correct repeater offset (it was 2.63 Mhz by default and goes in 50Hz steps, so .58 or .63 was the only option) and the auto repeater shift didnt work. Even though the seller would have taken it back I wanted to see if I could fix it first so I ordered the ADMS-1e software. I could program the correct repeater offsets with the software but if the radio was reset it would default back to 2.63mHz. I read all the "mods" and tried hexediting the .tpl file to change the band in this radio back to stock, but the software would always always give me a "corruped file" error when I tried to upload it to the radio.

I figured I would would try some of the hardware mods to get the radio to at least work like it should, a 600khz offset IS kind of important. After popping out the keypad I noticed someone had already tried both the solder pad and resister mod, they were obviously re-soldered. I figured what the heck and unsoldered jumper #1, which is supposed to be the mars/cap mod. Funny thing is the radio wouldnt even TX at all with this removed - just the opposite of what was supposed to happen. I guess someone tried to "hack' this radio at one time and screwed something up. At this point I called Yaesu and the gave me the generic "its messed up in hardware, send it in and we'll call you with a price." After talking and e-mailing around with several people someone suggested I try a freeware utility from Yugoslavia, it has a small "config" menu that lets you change bands without hexediting anything.

The good news is it worked, the radio was on band "C4" whatever that was. I returned it with the software to band "A1" which is the way the radio is supposed to be from the factory. I had the proper US offsets and ARS back, I also tried the mars/cap mod with the jumper removed and now it worked, interesting... I imagine I could use the software to switch bands, including the "wide freeband" mod but all I really wanted to do was get the radio to work as it should out of the box, I have no reason to TX out of band.

The way the radio is now all the advertised "mods" on the net work as they should - except hexediting the .tpl files, I assume they designed the newest revision (1e) software to prevent "hacking." I really like the radio, if I didnt I wouldnt have spent so much time getting it to work. I also hope this post will help someone out who has a radio with the same problem I had: screwed up repeater offsets and no ARS. The funny thing is that when I received the radio, it had no more capability then stock US (RX or TX) so I

have no idea what someone was trying to accomplish by modifying it the way they did.

Good luck and 73,
Kevin

PS: the FT50 programming software I used to fix the rig is at:
http://www2.crosswinds.net/frankfurt/~vlaski/

And of course you will need an interface cable, I bought the ADMS-1 software and the cable that came with it worked fine. Well worth the 39.00 so I dont go blind programming the radio by the keypad :-)

Repost from E-mail Response

> 1. Icom 706MKIIG

good choice

> 1a. temperature controlled transmit oscillator

unnecessary, unless you're running CLOVER

> 1b. voice synthesizer

. same here, and unless you're blind, not very useful either

> 1c. 350hz rtty/cw filter

good choice; either that or the 500

> 1d. 1.9khz IF ssb filter

doesn't help much in this rig, I bought a second FL100, put it in the 2nd slot
and 'lied' to the rig about having an SSB filter, that way, you can run tight
with AFSK modes

> 1e. 16' separation cable

OK

> 1f. main unit / front panel mounting brackets

needed, of course

> 1g. hm77a DTMF mic (better dtmf mic? remote control?)

personal preference item; I have one

> 1h. mb72 carrying handle?

Why?

> 2. MFJ 934 combo tuner / artificial ground

ehhh... use resonant antennas, and you won't need to waste power in the tuner
(suggest a double-bazooka made of RG174 for each band of interest)

> 3. MFJ 4225mv switching 22 amp power supply

the Samlex is a much better design, and costs less when on sale at TechAmerica

> 4. Ameco k-4 brass straight key (for starters;)

naah, get the Kent, or a Vibroplex Iambic Standard

> 5. battery / solar panel (help?)

gel cell and solar cells from a good hamfest; build the charger circuit from a FAR circuit board

> 6. random, j-pole, dipole, counterpoise wires

for what bands?

> 7. Pelican watertight case (better field op case??)

nice to have

> 8. automotive "spout" type connectors for all power connections (?)

the large Molex sold at radio Shack is a better choice, if installed properly, with heatshrink tubing

Thank you for spending so much time answering my post. With your permission, I'd love to post it on the newsgroup (as anonymous, if you prefer). I have a few more questions if you'd be so kind:
>> 1a. temperature controlled transmit oscillator
> unnecessary, unless you're running CLOVER

I may be working in temperature extremes, so I thought the TCXO would extend the cold weather operating range. True?

>> 1b. voice synthesizer
> same here, and unless you're blind, not very useful either

My thought here was if the LCD froze, or the bulb went out, I could still function. And I recently ran across an interesting quote- "I've heard of Icom mobiles that were left transmitting and got so hot they melted the front lens and burnt the
table they were sitting on - yet still worked." Another good reason? Oh, and yes, I've already lost one eye, so.....;-)

>> 1g. hm77a DTMF mic (better dtmf mic? remote control?)
>personal preference item; I have one

Have you recieved low audio reports with yours? I know the stock mic is bad, and read one post saying the same for the hm77a. I need a dtmf mic. Does hm77a have buttons to control radio functions or programmable button?

>> 6. random, j-pole, dipole, counterpoise wires
>for what bands?

Looking for most versatility for all band use in all situations (Condo base, campground, auto mobile, etc.). I'm thinking all wire antennas for compactness. Maybe random wire or dipole w/tuner for HF / 6, and Jpole for 6m or 2m/440 ? (or magmount when applicable)

Thanks again for all of your help!

>

>I may be working in temperature extremes, so I thought the TCXO would extend

>the cold weather operating range. True?

Yes, perhaps. But that also means that EVERY time you power up the rig, you
MUST wait at least 15 minutes before you can really use it, as the TCXO comes
up to teperature. The 706 is a handy radio, but it's not particularly good at
anything specifically. For example, it's not a good portable choice as it's a
current pig. You are describing an application for multiple, separate radios,
not one Swiss-Army knife.

>

>>> 1b. voice synthesizer

The constant Japanese-accented chattering will annoy you in about 20 minutes.
Buy it if you want to, it is a novelty that hasn't any value in operating.

>

>>> 1g. hm77a DTMF mic (better dtmf mic? remote control?)

>hm77a have buttons to control radio functions or programmable button?

My audio is just fine, and there isn't anything wrong with the stock mic. The IC706 "problems" people report are mostly due to the fact that this rig is very popular with 'newbies' and they are the hams that have the most trouble with their radios. Plus, these days, we have the Internet which allows people to complain easily on a worldwide basis.

>

>>> 6. random, j-pole, dipole, counterpoise wires

>6m or 2m/440 ? (or magmount when applicable)

Again, for portable ops below 30 MHz, resonant antennas are the way to go. Tuners are a bad idea. Pick your bands before you go. Watch what the QRPp guys do.

For above 30 MHz, you'd need an antenna that matches the band AND mode you are trying to use. For example: 6M SSB versus 6M FM, HUGE difference.

You may post anything you like to Usenet, but don't include my e-mail address.

Guys:

I don't know where you are coming from but I had a TS-950SD for a couple of years and the thing was SUPER! I used it SSB and the radio was easy to operate and just an all around great radio. I agree that the SDX was an improvement but I know several SD's that are truly loved by their owners. I hope your criticism of the radio is from a position of ownership and not just lip service from some belief that just because Kenwood came out with a new model that it must be better and the older one a dog.

Larry W9MDX

6188. FS: New, Unused W2IHY Audio Equalizer with Noise Gate

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-12 00:00:00 UTC
From: Jan N0JR <swanman@cfu.net>
Message-ID: <3762B671.F4F829F5@cfu.net>
Source record: 106073
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

New, unused, never removed from the box. The dialband equalizer adds presence to your audio while the noise gate eliminates amplifier fan and other background noise for cleaner, crisper audio. I have two of these on my radios now and they make a huge difference in poor band conditions or cutting through the pile-ups. This one is a back up, with manual and cables, set up for Kenwood but easily modifiable for any transceiver/transmitter. Costs $130, sell for $75. Tks es 73! Jan N0JR

6189. FS: Modular Systems Analog/Digital "Smart Filter"

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-12 00:00:00 UTC
From: Jan N0JR <swanman@cfu.net>
Message-ID: <3762BC16.B7995B4@cfu.net>
Source record: 106074
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.equipment

A hybrid, microcomputer-based, analog/digital switched-capacitance audio filter (SCAF), the "Smart Filter" is especially effective at eliminating adjacent noise and interference without ringing on SSB (hi freq and lo freq cutoffs), CW (as narrow as 100hz), RTTY, AMTOR, and PACKET. Effective with any receiver/transceiver (far better than the built-in bandpass filters on most modern rigs), but really adds selectivity to older designs. Excellent condition, works perfectly, with power supply and manual. $65. Tks es 73! Jan N0JR

6190. FS: Ameco PT-2 Transceiver/Receiver Preamplifier

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-12 00:00:00 UTC

I've had them both, in fact two MP's, one 776. Both are very good radios, they each have strong points and weak points. I am now with Kenwood. The 775 broke down (drivers predriver), this area is of concern to me as I know of others with this problem. I decided to move on to the Kenwood line and like it very much. Its been reliable. Good luck.

Hi, Larry --

No, actually I think it's great that you had good luck and satisfaction with your SD. I have always said that for ANYTHING ever made, you will find people who love it and people who hate it. Such opinions are usually formed based on what someone wants the radio to do, or what features an individual believes are important. Also, we form opinions based on experiences relative to OTHER stuff we've owned.

Having said that, I just found it somewhat unusual to see someone (Monte) actively seeking a 950SD, given its marginal reputation. Those who bought 'em new lived with 'em and maybe learned to love 'em, and that's great. But I stand by my advice to him to read the reviews, ask around, compare, and generally think twice about it. Word on the street is still that the 950SD is not for everyone. And if I were Monte, I would definitely want a "heads up" on the rig before making a decision. Fair enough?

And 'fess up: Didn't you at least raise an eyebrow when Kenwood so totally revamped the rig LESS THAN A YEAR into its production? How long did the TS-450 live? The '850?? That's reason enough to look upon the rig with some suspicion, even though I'm sure, as you have said, it has its merits.

In ANY case, none of this is meant to be taken PERSONALLY by any of my ham brethren.

73,
Steve

Wow! This is really getting surrealistic. Even most no-coders know how to send and recognize SOS (That's why they could use it in the show "believably". LA cops AFAIK, don't receive Morse training). Besides that, (a) it was a stupid plot device, (b) Martin Milner still can't act, and (c) TV shows are probably not a really great input to base federal communication policy upon.

Source record: 105949

Anybody else wander into HamCom this year? It seems every year, it gets weaker and smaller with less business and activity.

Friday night was sparse at best.
Saturday had a few programs but nothing spectacular. All the outside vendors shutdown about 1pm in preparation for the baseball game, then like a hurricane rolls through. Massive rain. Everybody went home.

Amateur testing was given on Saturday only. No testing sessions this Sunday. Larry Herring and the Dallas ARC were up in arms about political garbage, so he didn't perform the testing. Nobody could figure out who to contact.

Sunday, the commercial vendors (other than MFJ, Alinco, and a couple more) were gone, and half the tables were empty. A ghost-town. Most of the outside people packed up at 10am and went home.

On the big forsale net in Forth Worth, they announced a wrong time for the Skywarn class (2pm instead of 10am), so Sunday's talkin consisted of people handing out bad news.

Then they screwed up the drawing. The security desk said it occurred on Saturday (it didn't), then Sunday I heard them charging visitors "an extra four dollars for the drawing".
Why? It had already ended...

What a waste of ten dollars.

Have a old Kenwood TR-2600A 2M HT. Seems to be transmitting about 2 - 2.5KHz low. Too many adjustments inside the rig to just start messing with it. Any know the adjustment procedure? (or know where to find it?) Kenwood's site doesn't cover anything this old.

Thanks.

It's not the radiation directly, it's the effect of the radiation on the
ionosphere that disrupts communications. As I recall, HF "skip" propagation
is gonzo for many hours after a nuclear blast, but the effect should clear
up in 24 hours or so and you can go back to DXing... if you still have
a power source.

I don't recall any references offhand but if you really wanted references
instead of just confirmation that the effect exists, e-mail me and I will
see if I can find some.

Hi Keith,
I take my Icom 706 along on vacation with me when we rent a camp in Maine. I set up an entire station in a large camera bag. It consists of the 706, an MFJ 971 mini antenna tuner, and an Astron switching supply. I stuff a roll of speaker zip wire in the side pocket. I've had amazingly good results just reeling out about 150 ft of wire, zipping it in half, and making an end fed wire. I just route the wire out a window and drape it over tree branches or any nearby support. Then I take the other half of the zip wire and hook it to the ground of the tuner and lay it out around the floor of the house as best as possible to make a counterpoise. This work better than you can imagine and when you're done you just pull it in and wind it up. Obviously you need to avoid lengths of wire that will present a very high impedance at the feed point. Hope this helps.

Hello, all

I just got a used Pickup truck and have added a 2nd deep
cycle battery to the engine compartment.

Now, i have to add an isolator and then hook it up to charge
correctly.

So, i have visited my local RV shops and they seem clueless
on what actually needs to be done and what parts i will need.
one store did say that about 450 bucks and they would do it.

So, for the auto electrically gifted, I ask these questions.

first, what does an isolator actuallydo?
will it charge my two batteries when the engine is running?
what about 'jumping' should my main go dead? someone said
that there is a feature where you can flip a switch and the
device automatically hooks up the reserve battery....this i
find amazing.

as you may have guessed, i intend to use the extra batt to
run the accessories like RADIOS. also, audio stuff and maybe
even video for the backseat nonhams......

Also, what fusing setups have people used and any filtering
for the HF/VHF/UHF stuff?
I have seen the big stuff used for big audio amps and set ups
but this seems too expensive for me.

OK. enoguh. thanks in advance.

I recently aquired a Kenwood TS950-SDX. On the rear panel their is a reference oscillator (10KHz) input. What is this used for? The manual is not very clear on this point. Internally, in my radio, the TXCO 20MHz oscillator option is installed. Associated with this oscillator, there is also a switch, which obviously switched between the regular ocilator and the TXCO. The TXCO in my radio is not adjustable, it is a completely sealed unit. What do I need the external 10 KHz reference for?? What has to be zero beat with 10 KHz???? I do not have a problem, I am just very curious!

Hi Keith, I often travel and stay in motel rooms.
Radio above 50 mhz is not difficult but HF hamming is.
If you are traveling by car then consider a Mag mounted mobile antenna with enough coax to reach into your ground floor motel room. Park the car in front of the room, lay out the coax to your radio, and you are onthe air.

6239. KENWOOD 950SDX SPEECH PROCESSOR

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-13 00:00:00 UTC
From: rong@computer.net
Message-ID: <3763a697.506621@news.computer.net>
Source record: 106009

I just got a used 950SDX. How do you guys adjust the speech processor properly ??? The instructions in the manual are very vague. My manual tells me to adjust the "processor out" so the meter deflection is within the "alc range". Then it says adjust the "processor in" for a maximum of 10db on the compression scale. It makes no mention of where to set the mic gain. The mic gain control seems to have no effect when the processor is on, and when the processor is on. it is very difficult to make those 2 adjustments and keep the alc reading within the proper range. Unless both controls are "up" I can't get any alc reading at all. My radio is a fairly early SDX--manufactured in 10/92---maybe it needs an update. By the way, what are the updates that are in the newer ones that the older ones are deficient in ???

Thanks & 73

6240. Re: KENWOOD 950SDX SPEECH PROCESSOR

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-13 00:00:00 UTC
From: Keith Hester <ks9c@chorus.net>
Message-ID: <3763BB2A.45D163D8@chorus.net>
Source record: 106010

Hi Ron,

Your observation is correct: The PROCESSOR IN control IS the mic control when processing. The first step is to adjust this control until no more than 10dB of compression is shown on the COMP meter. The next step is to adjust PROCESSOR OUT so as to obtain normal ALC. You should not attempt to control the amount of ALC via any adjustment of PROCESSOR IN.

You will likely find that digital noise from the DSP may produce a low-level noise floor that can be heard on the air when processing. Without making a mod to the SDX, the best means of minimizing this effect (if it is even noticeable) is to use no more ALC as is actually required! If this noise really "ticks you off", you can send me an e-mail and I'll provide you with a circuit mod (my own, not Kenwood's; it will work, but I cannot offer any guarantee).

This same noise is actually present when not processing, but is at such a low level that it cannot be detected. The processor, however, reveals it because of the inordinantly high gain in the processor circuit.

The SDX is such a good sounding rig without the processor... why do you want to ruin it with processing? It is an extremely rare situation when processing will actually result in improved intelligility.

Regards,
Keith (KS9C)

Hi Hofie,

That 10 kHz input is virtually useless for normal amateur use. When you want to know if your TCXO is on frequency, working with WWV is the best choice.

The technique for checking whether it is on frequency or not is to (1) tune in a convenient WWV signal in CW mode and narrow filters (to remove modulation garbage that may be on WWV). (2) close your CW key to produce a sidetone. Adjust AF control so as both tones are roughly at the same level. If the TCXO is off, you will hear a beat between the 2 tones (sidetone & WWV). Tuning the dial for zero beat will reveal the actual error. If you wish to adjust the TCXO, the dial should be returned to exactly 10.000.00 MHz (or 15 or 20... whichever gives best WWV signal) and then adjust trimmer for zero beat.

You should be aware that even the TCXO will drift some. If you choose to make a correction, it should be done only after the SDX has been on for some time and room temperature/humidity conditions are normal.

Bye-bye,
Keith (KS9C)

Nick,
If you are looking for 2M only, I have found the AEA Hot Rod to be the
best. For dual band use the AL 800 by Premier provides good performance.
Smiley Antenna is a product line also worth checking. I use the dualbander.
It has a somewhat flexible loadiung coil section. The AL800 is a bit better,
but to big for my use. The name is not so well known, but I think the
products are very good and a little less costly than the big names.

I have had three Scouts. Two were brand new and one was used. At 25-30
WPM the rigs would jump right out of the other fellow's bandpass. At
very slow speeds and on SSB they worked just fine. I loved the little
rig and enjoyed the receiver very much, but I will never have another
until TT fixes the durned thing. People would tell me I was using a
Scout before I would tell them because of the frequency jumping

Improved over the 98 version. Fewer commercial vendors, but the flea market appeared to be much better attended by buyers and sellers.

The tech sessions were somewhat limited thought the FCC session was very interesting and entertaining. The Linux discussion was useful also.

Prices on equipment in the flea areas were high, don't know how much actually sold. Some very nice Collins restorations with matching prices.

Attendance appeared to be up, but thats a qualitative view. The few commercial vendors that I talked to said that their sales were up. Some said as much as 25% by mid morning on Sunday.

There were no vendors selling slot machines this year. Nice improvement.

Be back next year. I believe that this may be the much needed swing back to the growth side.

I operate almost 100% on HF and I can also tell when the ham I am
talking to is using a Scout. Even at relatively slow speeds, 10 wpm, the
movement is noticable. If you are looking for an inexpensive way to get
back into CW I think some of the better quality boat anchors would be a
better choice. Or even a Ten Tec Century 21, a full break in CW rig
availble for around $150.

In any case I glad to see another CW operator on the air.

Six meters is an interesting band.

You will find more openings on 6 meter sideband than in FM, however FM only equipment is cheaper. Another thing to consider is your antenna. Most 6 meter SSB transmissions are horizontally polarized and most FM transmissions are vertically polarized.

You can make the two polarizations work, (i.e.- transmit FM on a horizontally polarized yagi), but bear in mind there is a 20db loss when you cross polarize signals. Also, since the SSB portion of the band is lower in frequency than the FM portion, the antenna may not match up very well.

If you have a lot of local 6 meter activity in your area, I think you would enjoy 6-FM. If there isn't much activity, you would probably do better with a multi-mode rig and a yagi antenna.

Message-ID: <3765217A.ADDBD31C@uswest.com>
Source record: 105888

I have a Yaesu FT-102 that needs some work on the receiver. Recently it has become pretty deaf accross the bands. Strong signals 57+ come through OK but it can't hear anything else. I suspect the problem is in the RF board, perhaps the RF Amp. Also the RX/TX relays are suspect. I have a service note that indicates there was a problem with these relays and that revised ones were made available. I don't know if these we replaced in my unit. I will open it up and start troubleshooting but would like to hear from anyone who has experienced this problem for some advice and/or help.

Thanks & 73

I am looking for a relatively inexpensive dual band mobile rig. I am look for something in good working condition or something that needs minimal repair. I don't care how old it is or how it looks, as long as it works. E-mail me with details and price.

Thanks,

This is the classic problem with this rig. Swallow hard, have the relays replaced, and then enjoy one of the finest tube rigs ever made. There are several guys who advertise in the back of QST who service these radios. Best of luck.

Mike, N4PDY

6275. Wanted -- Kenwood BS-5 Pan Display Plug-in

I have 3 or 4 D45MWA5GB7AK mobiles that I want to trade for one of the
following:
Yaesu FT-8500 or FT-8100
Alinco DR605 or DR610
Icom A22 with batteries and charger
Kenwood TM-G707
Oregon Scientific WR-8800
Garmin GPS-III with software
Icom IC-T8A with batteries and charger
Or just about anything else that you would like to trade for. As you can
see from the list, I am
interested in dual band mobiles or handheld units. Email me with a list
of what you want to trade
and I will answer it promptly.

6277. Re: SGC-2020 - v - Elecraft K2

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-14 00:00:00 UTC
From: Phil Wheeler <w7ox@mindspring.com>
Message-ID: <37653A6F.A32EB33C@mindspring.com>
Source record: 105894

Gary,

I'd check the specs, particularly with regard to power consumption, but also on performance.

Need date is also an issue: the K2 is a kit, so you have to receive it (mine has been on order for about 3 weeks and I expect I have 3 more weeks to wait), and then you must build it (I plan to take a few weeks for that). So if you want a K2, getting a kit and building it before Aug 1 or so could be an issue. ALSO the SSB in the K2 is an option, and I do not think that will be available until sometime in July.

If you need "off the shelf", the Ten-Tec 555 Scout is worth a look along side the SGC-2020; not QRP but there is a mod which will make it so (with lower power consumption than simply cranking it down to 5 watts). But I believe its RX power drain is pretty high vs. the K2.

6278. CW Filters for Kenwood TS-570

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-14 00:00:00 UTC
From: Phil Wheeler <w7ox@mindspring.com>
Message-ID: <37653B78.701C4EE8@mindspring.com>
Source record: 105895

I currently use my TS-570 on CW with a 500 Hz filter. I'm considering replacing it with a 270 Hz filter. However, doing so affects the available AF filter bandwidths on CW.

Is anyone operating a TS-570 on CW (and RTTY/digital) with the 270 Hz filter? If so, are you satisfied with it and are there any negatives?

Thanks in advance!

Source record: 105896

First, the extra battery is ONLY for guys who need to run the extra radios when the engine is NOT running - when running, the generator can handle it all (at least, mine can - 135A).

Any good RV supply store should have an isolator of the relay type - it looks like an automobile starter relay and costs around $15. Wire it to connect the two batteries when activated. Activate it by supplying 12 from a point on your fuse panel that is hot only when the ignition switch is ON (and be sure to connect a reverse-biased diode across the isolator's coil to avoid frying the car's electronics).

Then just switching the truck on will connect the two batteries for charging/jumping/whatever, but switching off will protect the starter battery from being discharged. Connect the extra radios, etc directly to the deep-cycle battery and enjoy...

>
>Can someone hlep me on this. THanks in advance.

If you want to talk mainly on local 6m repeaters, they're going to be FM for the most part, so all you need is an FM rig. The other modes would be wasted.

But if you want to do any DX work, SSB would be your main mode, so you'd do best with an all-mode rig.

I got on 6 meters in the late 50s, running 5 watts on an AM rig, and had a blast, both locally, and during band openings, working DX. (This was before repeaters.)

You'd be missing out on much of the fun of 6 meters with just an FM rig, as the DX openings can be just wild...

Shinwa also makes a similar unit. Same size but I think it has a broader freq range than the RZ-1. It comes with a wireless remote but it doesn't have the video output. I know of one for sale but it's around the 325.00 range.

Don.

NOTE: SOME OF THESE ITEMS WILL REQUIRE REPAIR.....

Yaesu FT101E Needs output tubes, case rough, some rust
inside and out. Receiver is very good. FIX board has 2 Xtals
installed, SSB filter-Yaesu 3180 KHz CW filter-Fox Tango
3179.3 KHz. Xtals for AUX and 10D are missing.
I can tell by inspection that output tubes are bad, I have
no transmitted on this rig so I cannot confirm/deny additional
problems. $100.00 + shipping

ICOM IC-551D - Working fine when stored. After short
usage after setting back up, no RF output, scratchy
controls. Cleaned controls, replaced 2 trimmer pots,
removed 80 watt PA and reconfigured for 10 Watt operation.
FIrst contact after putting back on air resulted in good signal,
but badly distorted audio. Disgusted, I put back into original
box along with the PA PCB, power cord, etc. Have the manual
and schematics for it as well as the IC-551 . Has FM option
board installed. 250.00 + shipping

Central Lab 20A Multiphase Exciter - Above Average overall
condition. Was last used by local ham for MARS operation.
Have original manual and schematic reprint. Setup, operation
and alignment covered in manal. 75.00 + shipping

DANA 8020B Electronic Counter - Bench Unit 10 HZ to 550 MHz.
Frequency, Period, Multiple Period Average and Totalize modes.
With instruction/service manual. NEEDS POWER TRANSFORMER.
Worked fine until age took its toll. 75.00 + shipping

Hammurland HQ-129-X SW Receiver. Desktop case. original manual.
Very good condition. .54 to 32 MHz. Good working condition; some
controls are beginning to get scratchy. 150.00 + shipping (HEAVY)

Interested in good working test gear, all-mode monitoring gear, wideband
fm receivers, data decoding gear for radio data, VHF/UHF RX/TX gear.

Thanks,
David

FS: Commercial HF Kilowatt amplifier built by ITT-McKay (model MR-105-8B). This amp was removed from commercial service and tunes 2-24mhz continuous. It had a 3-phase power supply that I dumped so the buyer has to supply his own supply. The tubes appear (without having to remove them) to be about the size of a 3-500z or 4-500A size. The inductors and capacitors are large and rugged. It also appears that it can be remote tuned. I have a partial manual. This is a very modern looking amp with 3 modern looking rectangular meters across the top front panel. I will well it for $275, u-pay-ship. Mike (409) 693-1461.

6302. For Sale or Trade: Kenwood DSP-100

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-14 00:00:00 UTC

Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.swap

For Sale: Kenwood DSP-100 in excellent, like-new condition. Cables, manual included. Plugs directly into your TS-450, TS-850, etc. Gives you ability to vary the sound of your SSB signal from deep, rich "broadcast quality" to a sharp, narrow signal for contests and pileups. Also adds carrier suppression and unwanted-sideband suppression. Can set CW rise and decay (fast vs. slow). Gives you transmit DSP functionality like some of the newest rigs.

Sell for $400 (or best offer) and will split shipping cost anywhere in continental USA. Will consider partial or straight-up trades for comparable value. Feel free to run something by me!

73, Steve W3SY

You may want to review the circuitry of the IT 1 tuning package which drives a capacitor for tuning purposes.(loop antenna) It is set up with the use of a microprocessor and also can be controlled by a computor.Surely somebody has made an equivalent considering the interest in loop antennas.

Source record: 105962
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Greetings,

I wish to sell or swap my Yaesu FT-900AT. This radio is in excellent working and cosmetic condition, with only a small scratch in the lower right corner of the display to prevent my calling it "near mint". The scratch is not visible when the display is lit, and the set is otherwise free of flaws. The YSK-900 Separation Kit and MH-31 Microphone are included with the radio, along with the original manual (and I think I have the box, somewhere).

I have enjoyed using the FT-900, but have too many newer radios. :-) I am looking to sell the set outright, or would consider a trade of a clean R-390 or R-390A receiver and cash, or a newer Pentium-class laptop computer in exchange for the Yaesu.

My cash price is $725 shipped to the Lower 48 States; actual shipping charges apply elsewhere.

Please e-mail with questions, and thanks for reading my post.

73,

Tony N8SNC

YES!!! This radio is very modifiable.. My FT-50R will work
144/220/440/900 TX, YES 220/900TX.. This is very possible, There is
nothing in my area on 900 MHz but 220 there are a few repeaters left.
Too bad it's not an all mode like my FT-847, I'd like to have used it
tonight for the VHF qso Party.... 73 Jeff Just remember, Some people
just have to ADD opinions..

Bob,
I have an FT-290 but have the FT-290 MK II manual.
For setting repeater offset--you can't on the FT-290. In order to operate on a repeater, you need to split between memory which you set to one frequency and VFO which you set to the other. Clumsy but it works.

>Does it have a mouse and if so where?

I had the Contura 486/25 which suceeded this model. The "mouse" is really a little trackball that is integrated into the case. It's a neat design, but you have to keep the trackball immaculately clean or it will skip - the mouse will not move accurately. The nice thing about this computer is that it's small. Mine weighed less than 7 pounds.

It was a fun toy while it lasted, but the ribbon cable inside leading up to the display broke, making mine useless. I opted for the Toshiba 2150CDT instead of fixing it.

ggs@my-deja.com wrote:

> I just can't wait to see how you misquote me this time.

I feel compelled to set the record straight...just in case anyone here just might be reading Gerald's tripe.

Let's quote Gerry directly on six "points" he alleges in this thread alone:

1. "A public statement by RT that Bradford etal do not represent their firm would go a long way toward repairing the public relations damage he has done."

2. "Your bullshit leaves such a bad impression that it is actually hurting RT Systems."

3. "I had a nice chat with RT Systems apparently you are a bit of an embarassments to them but there is little they can do about you."

4. "The other things I learned gave me a lot more insight into your real motives. It is certainly strange that someone so supportive of RT Systems and the ADMS software would want the command codes for the Yaesu radios. That looks more like someone who intends to produce a knockoff rather than someone who supports RT Systems and the ADMS software."

5. "It is apparent that what you really want to do is to produce your own product it was all quite interesting. You sir are a liar and a fraud and are simply trying to divert attention from this."

6. "...that it was obvious you wanted to develop a competitor to ADMS. Or perhaps you just want the Yaesu command codes to be a big shot. Why don't you just figure them out like Goran did. Perhaps you're just too lazy and unmotivated as we have previously discussed."

You cannot use Karen nor Rod at RT as your "source" for your accusations. As a matter of fact, you cannot provide the name of ANY principal at RT Systems who will back you up on any of the above.

You cannot provide legitimate copies of anything I have ever written asking for "codes" for anything. Nor can you demonstrate any interest of mine to get involved in any such project in ANY forum/medium.

I do not know why you invent such silliness, Gerry. But it's quite boring, actually.

>Thanks

I REALLY like my new VX-5R. I am also quite impressed with the reception, even in the AM shortwave and medium wave bands. The memories are not quite as user friendly as what a dedicated scanner would be, although you can do most things with it as you could with a dedicated receiver, it is just a little trickier, for instance: instead of a search feature, for scanning between two given "parameter" frequencies, you have a set of 10 "band limit" memories, in which you store the lower limit frequency and the upper limit frequency, then access the memories to scan between them. Also the scan "resume" modes might take some getting used to, in which you have a choice of "carrier drop" resume mode, which pauses long enough for the transmission carrier to stop, them immediately resumes scanning (a 2 or 3 second delay would be nice here, to catch any responses), a "hold" mode, in which the scanning stops anytime the squelch is broken, (scanning has to be reactivated manually), and the "5 second" option, which gives you 5 seconds (MAXIMUM!) to stop the scanning yourself if you hear anything interesting, otherwise it starts back whether or not the received signal is finished transmitting or not. I would recommend the VX-5R to anyone, as it is a rugged little unit with suprising power, but I think that using it just for its wideband receiving capabilities would be overlooking a lot of its best features. I can't imagine ever wanting to get rid of mine for any reason.

Paul

6340. IC-735 keyer speed problem

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-15 00:00:00 UTC
From: gagnon@gagnon.fakeu-net.com
Message-ID: <3766b1a9.3563183@news.u-net.com>
Source record: 105736

As many already know the Icom keyer unit for the ICOM 735 rig uses the mic gain slider control as the keyer speed control. Because it is a log pot the keyer speed is very difficult to adjust, with very little play allowed for great increases in keyer speed -- generally not very acceptable.

I have heard of certain modifications for this problem - such as using the squelch control instead etc. Does anyone out there have any more definitive info on such mods???

I would really appreciate a response.

Cheers....Larry Gagnon MW0AWC

Bradford you must have no life. I tried to explain the effect
your tirades have on people. Your reaction is to misquote
me take what I actually did say out of context to try
and make some obscure point. By misquoting me you are in effect
a liar. I learned a lot about you this weekend at Hamcom.
I had a nice chat with RT Systems apparently you are a
bit of an embarassments to them but there is little they
can do about you. BTW I did buy some stuff from them.

The other things I learned gave me a lot more insight into
your real motives. It is certainly strange that someone
so supportive of RT Systems and the ADMS software would
want the command codes for the Yaesu radios. That looks
more like someone who intends to produce a knockoff rather
than someone who supports RT Systems and the ADMS software.

It is apparent that what you really want to do is to
produce your own product it was all quite interesting.
You sir are a liar and a fraud and are simply trying to
divert attention from this.

: Too bad it's not an all mode like my FT-847, I'd like to have used it
: tonight for the VHF qso Party.... 73 Jeff Just remember, Some people
: just have to ADD opinions..

While the '50 WILL TX a SMALL carrier on 220, with so-so RX at BEST, how in HECK can you get 900 TX on it(or is it one of those "tricks" that ends up putting millwatts out at 900, and several WATTS at 450 Mhz)?
As for the 220 performance-I've had no real success there with the '50....the RX is so poor(at least on my unit), that I've never heard anyone on 220(however, I CAN hear my old IC-3at 220 HT on the '50).

I've had trouble with any antenna other than the rubber ducky that
comes with W32A. ICOM claims this is 'normal' -- that the radio has
been optimized for the rubber ducky. Frankly, I don't believe them.
I'd love to hear what your experience turns out to be.

Message-ID: <19990615003437.15616.00002010@ng-cb1.aol.com>
Source record: 105792

I am a new technician and am wondering about buying a HT fro 2m/70cm plus scanning ability.

I am looking at the icom IC-Q7A and Yaesu VX-5R

I wonder how well the receivers work on these units as scanners?

I also wonder how much power a person wants for a general purpose HT? Is 350 mW enough (IC-Q7A) or is the 4.5 to 5 watts of the VX-5R mour appropriate.

I am a casual user who is curious about vhf/ush and expect to carry the unit while hiking etc.

Any recommendations are welcome.

Thanks

For the price the radio is offered, Don't bother buying a used one.

I own one and I like it, however it is not in the mobile any longer,
for the same reason mentioned below by the other fellow- got washed
out in sunlight. It might just work fine if you have a big car or a
van or something where you can put the head so that not a lot of light
is hitting it. Other thing you may run into is the front end isn't
the tightest I've seen, it can get clobbered by intermod. Not
nearly as bad as, say, an alinco, but definitely not as good as my
FT8000 was at killing intermod.

As far as transmitter was concerned, I thought that was the best part
of the rig. on 2M the thing will peg a 50W bird slug, I'm
estimating mine does about 60W. The audio is great....

Chances are the "bad sound" you heard was a broken microphone or
a mistreated radio.

Sivert,

You need to take a course in reading comprehension. Once again
you draw an inaccurate conclusions from what I said. I never
said you had any amateur radio products just that it was
obvious you wanted to develop a competitor to ADMS. Or perhaps
you just want the Yaesu command codes to be a big shot. Why
don't you just figure them out like Goran did. Perhaps you're
just too lazy and unmotivated as we have previously discussed.

I just can't wait to see how you misquote me this time.

6396. Need Alignment Procedure for Icom IC-2A Handheld

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-15 00:00:00 UTC
From: jvm@inmind.com
Message-ID: <3766539a.2669038@news.inmind.net>
Source record: 105809

Hi All !

Recently purchased an Icom IC-2A at a hamfest. TX works ok,
but on RX it's deaf as a post ! I can barely detect a change in
the noise when turning a strong RF signal near the antenna
on & off.

Hoping it's out of alignment, I would like to find the correct
alignment procedure. The schematic and parts layout was
included with the rig, but no service info.

Is there a service manual ?

Thanks for any leads !

73,

Jim Morgan W4QE

I saw the SGC-2020 in Dayton and liked it a lot. It is very rugged and seems
to work well.

However, I did not like its receiver concept when I read the QST test
report. it is pretty primitive, but maybe that should not be an argument if
the radio is doing the job.

But I myself would buy the latest IC-706 model, I don't think anything
canbeat that radio in terms of versatility, construction and features

You need to calm down a little. I have no idea what you are referring
to. I have NEVER asked ANYONE for any "command codes" for anything
Yaesu. Wouldn't know what to do with 'em if I had them. I do not program
- and personally know no programmers working on any such project.

Chill out.

>
> Any recommendations are welcome.
>
> Thanks

The low-power units are OK only if you (a) live in a repeater-rich
area (like LA) and (b) you don't plan to take them elsewhere. You
say you want to take an HT hiking - would you be talking simplex
with your hiking companions, or hoping to reach repeaters back in
"civilization"? If the latter, you'll need all the range you can
get. Don't bother with the Q7A or the VX-1R (Yaesu's micro-mini).
Stick to the 5W models, and be aware that even those may not reach
out of the boonies with stock rubber ducks. Buy a high-efficiency
aftermarket antenna - an Arrow walking-stick Yagi, for example, to
maximize range. You STILL may need to climb a hill to be heard.

Good luck, and 73 -

Bob, KI8AB

Oguzhan-

The TS-120S doesn't use a PLL. It uses the older analog VFO technology,
and does drift in frequency.

Depending on how much yours drifts, it may be normal. There was a factory
mod that replaced a capacitor in the VFO with one that had a different
amount of temperature compensation. However, it only applied to the
earlier serial numbers, so yours may already have it installed.

I don't know if it will help, but Kenwood used to have a number for parts,
at (800) 637-0388.

The ULTIMATE portable SSB rig in my opinion is the Tokyo High Power 750-HT, a tri-bander for 6/15/40m. It's the size of a large 2m HT and uses 8-AA cells, puts out about 2w ssb/cw, digital display, low power consumption and has a whip antenna that fits nicely on the unit. Problem is they are only available from Japan. I've owned one for several years and it is by far the most versatile portable rig made...in my humble opinion.

For something more immediately available (and affordable!) I would go for a MFJ-9420...the 20m version of their portable rigs. The cabinet is fairly rugged, but best of all if you trash it in the woods, its not a lot of $$! Its also very fixable, with all components on 1-board. Also...20m is a good overall band and propagation has been very good lately, with the band staying open into late at night. Also...the antenna is not so long as to present a problem while back-packing it.
My 2-cents,
73,es good luck!

Dennis, good point, don't know that particular rig but it sure sounds interesting

Actually, if you really think about it, I do not understand why none of the big 3 have ever brought out an SSB HT for the HF bands

Such a rig was actually developed during WWII, the BC-611 which was a portable AM radio operating at 3885 kHz, in walkie-talkie style.
Although it only had a whip antenna of about 3 ft long, it had no problem getting a range of about 5 mile over the ground-wave. Not bad for a 1 watt tube radio.
Imagine if the same would be developed again as SSB radio, in HT style...

Likely the 706 and the FT-100 draw too much current for his Gel-Cell portable application. If I remember correctly, my 706MkII pulls something like 2 amps on receive -- vs. 0.2 amps with a radio designed for portable use like the K2.

However, I agree with your assessment of the 2020; but for SSB, it will probably do what he wants.

Phil

6415. FS: ### 4-channel VHF Portable... CHEAP

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-15 00:00:00 UTC
From: pdfdisp@aol.com
Message-ID: <19990615151011.14662.00000333@ng-ch1.aol.com>
Source record: 105828

For Sale: Maxon SP-120 VHF Portable Radio... Only 4 months old!!!

4 channels (rotary switch selector)
2 watt output
148-174 MHz frequency range
Lapel mic jack
Multiple Scanning functions
CTCSS/DCS capable
AC plug-in charger
Radio comes programmed to your specs

Original manufacturer's Programming software also included. Get complete details and specs at Maxon's official site:
http://www.maxonusa.com/specsht1.htm#SP-120

Radio is in excellent shape. It's been used very infrequently over the 4 months that I've owned it. Selling just because I don't need it anymore. They sell new for $220, plus $80 for the programming software, so package is worth $300. Looking to get $180 plus shipping. MUST SELL ASAP!! Picture available via email on request.

RADIO IS UP FOR AUCTION ONLINE AT http://auctions.yahoo.com/auction/4985633

Please email PDFDISP@aol.com for more info. Thanks!

6416. FS: ### 6-channel VHF Portable... CHEAP

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-15 00:00:00 UTC
From: pdfdisp@aol.com
Message-ID: <19990615151035.14662.00000334@ng-ch1.aol.com>

For Sale: Vertex (Yaesu) FTH-2009 VHF Portable Radio.

6 channels (rotary switch selector)
5 watt or 1 watt output (switch selectable)
Lapel mic jack
Programmable Scanning functions
CTCSS/DCS capable
Deluxe drop-in charger (worth $70 alone!)
Original manufacturer's Programming software and programming cable

Radio is in excellent shape. I've seen them selling new for $289, plus $70 for the charger, and $100 for the programming kit - so package is worth over $450! Only looking for $250/OBO, plus shipping. MUST SELL ASAP!! Picture available via email on request.

RADIO IS UP FOR AUCTION ONLINE AT http://auctions.yahoo.com/auction/5199766

Please email PDFDISP@aol.com for more info. Thanks!

You sir ar a liar. You not only have asked for the command
codes on several occasions but have been reported to be
rather unpleasant when your request was turned down. With
two responses I must have touched a nerve. I think I'll
look into this topic further.

> - and personally know no programmers working on any such project.

Message-ID: <3766F18F.7724@flash.net>
Source record: 105770

Super duty transformer mfg by Osborne transformer in Detroit. 4000 or 5650 Volts center tapped output at 500 mA continuous duty. Rated at 1.98 kVA with 220 or 110 Volt input. Size is approx 9" deep by 7.5 " wide and 10" to insulator tips. I would guess weight at about 50 pounds. It has never been used (to my knowledge) and does not flash over with 160 Volts applied to the 110 Volt inputs in very humid conditions. I was going to build an amplifier with it a few years back but lost interest. I'm not interested in shipping this thing.... pick it up in southeastern Michigan (Detroit) area for $75 or might trade for 300 watt roller inductor antenna tuner.

Source record: 105773

I don't even own a VX5 and would recommend it over the Q7. If you want to talk to someone with a HT, you need 4 or 5 watts. 350mw will only make you wish that you had 5 watts.

I have the R2 which is almost the same has the VX5. The R2 is a great scanner. Great audio for such a small rig. Very good sensitivity.

Good luck.

I don't threaten people, Gerry. I simply tell the truth. And anyone who reads our history of posts can tell who is trying to assist others with amateur radio-related inquiries, and who likes innuendo, character assassination, and arrogance.

> You know full well who you asked for the
> command codes you know you did it.

I have never in my life asked anyone for a "command code" for anything. You have no proof. You have no witness. You have no legitimate email post (you can tell every one of my posts - I use my real name all the time). You have no such "correspondence" from me.

I have no idea why you continue your little-minded, petty vendetta against one who has a demonstrable record of providing accurate and helpful information in this newsgroup.

Yet again - as if anyone really cares but you - I have never - REPEAT:
"NEVER" - asked ANYONE for any such thing.

You cannot prove it ever occurred. At best, you have mistaken me with
someone else. At worstm you simply like to try to assassinate the
character of folks who like to assist others in public.

Which is it, Gerry?

Who has the demonstrable history of assisting folks here? And who hides
his tracks and deletes his older posts and uses different login names to
eliminate his posting history?

I don't believe I ever cited a source at RT Systems or anywhere
else for that matter. In fact I have not named a source. The
source I have is good much more reliable than you but is, and shall
remain, unnamed.

Your calling and annoying Karen and Rod over our little internet
spat is unconscionable. I have no desire to make any difficulty
for RT or any other businees so I quit. You have no sense of honor
or proper behavior and continuing would just expose the innocent
to your bull shit.

>
> You cannot provide legitimate copies of anything I have
> ever written asking for "codes" for anything. Nor can you

Mainly just a mod in the power supply. This is the same mod you see in
all the 830 mod updates. Other than that , there is no real difference.
The gold label is after serial # 200000 I believe which means any 830
built in 82 or after is a gold label. I have a 82 TS830 which is a gold
label. Any 830 is good, as you can modify any silver 830 to be the same
as a gold. Also I recommend the Rick Measures mods for the 830. The VBT
alignment is real good the way he recommends it. I've done every mod I
can think of on mine. It's a good old radio. I still use it, because it
can keep up with most of the new stuff. And I can work on it. MK

> something else when they catch up to you......

Here in Houston, if they catch you with a transmitable uhf radio that
will access police, they will throw you in jail just for possesion of
it. I know a guy , who at the time was a "student cop". That is he had
been thru police academy and was waiting a job with a dept. He had a
sabre radio in his car, and had car trouble. When he went to a auto
parts store and came back, the police were checking out his car a
possible stolen. They say the little sabre ht on the seat, and
determined that it was capable of transmitting on police bands. They
threw him in jail even though he had never transmitted with it. He had
the radio to be able to use ham bands and listen to pd on the same
radio. I think they eventually dropped the charges, but it took a while.
Moral: Most police agencies are retentive about possible bootleggers .I
wouldn't do it. MK

Looking to sell the above mentioned radio. It is in like new condition and has hardly been used. In emails yto me, people have mentioned that this radio goes brand new for $425 or more, depending on where you get it from and what area of the country you're in too. I would like to get $350 plus S/H for this unit and again, it is in like new condition. If you have any questions or if interested, respond to the above address. Thanks.

Very nice Heathkit SB-220 10-80 meter amp.Has good output...1000 on 40 and 800 on 10 with 100 watts in. This is on 110vac and i'm sure it will do more if wired for 220. This is a "later" model with the longer plate cap.Has original manual with Heathkit up date flyers.Face is perfect and case only has two very small (1/4") paint chips. An easy 9 on a 1-10 scale. Price is $525.00 + boxing and shipping from 96003.

Take care,
Stan (530)241-0843 KF6IKC@webtv.net

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. If you wish to
purchase a new receiver with "Plectron-like" signaling
capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Source record: 105847

Hello. I'm wondering if the Icom IC-756 HF/6m radio is a good buy or not? I would mainly use it on RTTY/SSB/CW on 80m-10m. I would mainly be rag-chewing, working DX and using it for contests. Any particular feelings/opinions you happen to have about the radio I would appreciate hearing. I have already compared this radio to the FT-920 rig and I'm not interested in hearing about that radio. Please don't recommend it to me. Thanks a lot and let me know if you can help.

Hello. I have a few questions on the Dentron ClippertonL HF amp and I was wondering if anyone could help out. Please let me know if you can provide any input on any of the bellow questions. Thanks a lot for reading.

1. I've heard that the amp will run on a regular 110 plug, but it's not recommended. Is this true, and why is it not recommended?

2. What modes will it do and what power will it put out on all of those modes generally?

3. Will it cover 160m-10m including 12m/17m with full output?

4. Is this a generally good and dependable amp (especially in contesting)?

5. Is there anything else that I should know about this amp and do you happen to know of a picture of it on-line?

6. About how much does one go for used in good condition today?

I have one and like it very much. I operate contests at a multi-multi
station where we replaced all the transceivers with IC-756s because of
their really good phase noise properties. RTTY FSK is built in if you
have a TU, or you can use AFSK and a TNC. There is the option of 1 Hz
tuning and that makes PSK31 and RTTY very nice to tune in. The built
in keyer is smooth and covers the right speed range. Good rig.

Just keep in mind, all the major rigs have characteristics and
idiosyncracies that introduce an element of personal taste into
whether you ultimately like them or not. Very few of us use our rigs
in ways where a few dB difference in dynamic range, for example, would
be noticable or significant.

Good luck,

73

Source record: 105851

Hi Fellas;
I have for SALE:
Kenwood ts-430s in the original carton with Manual, Cable.
It's in Excellent condition.
Power output is low on some bands, like 25 watts but better on others.
All else is Fine, please do not e-mail me asking about any options, THERE ARE
NONE, never were!
Price is $310ppd Conus!
Any QRP'ers out there? Fine as -is for them.
Thanks es 73....Rich WA2RQY (1961)

>it's small. Mine weighed less than 7 pounds.

I have one of these, and love it. It is nice & small. It has a floppy drive that plugs into the PCMCIA slot. I also use a mouse connected to the serial port, which is much easier to use than the trackball. You are right, the trackball is particularly bad about skipping when it gets dirty, which is one reason I got a serial mouse for it. Luckily, the software is set up to detect the mouse, if not there it uses the trackball. I wish the screen were color instead of monochrome, but it does the job I use it for. BTW, mine's not for sale.

Tom

6458. Icom IC-775DSP or Yaesu FT-1000MP

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-16 00:00:00 UTC
From: RichardLord@dial.pipex.com
Message-ID: <37692f58.5682530@news.dial.pipex.com>
Source record: 105857

Having got my interest back again (after 12 years!) I had bought a second hand FT-901. I kept it 3 days (nice set but the virus bit badly) and I traded it back in for a Kenwood 870S. Ultra stable and losts of bells and whistles, but I could not live with its constant high frequency hiss and hash noise caused by the (DSP I am told). I wanted a much quieter noise floor on receive for ease of listening - I have done 30 years as a ships operator, so I know about listening fatigue after hours of watch keeping duty.

So I have asked the long suffering dealer if I can upgrade (I can't very well move sideways and expect to get all my money back).

The 2 pieces of kit that seem very cool (and b....y) expensive are the Icom IC-775DSP and the Yaesu FT-1000MP. The Icom costs the most, it offers several nice options including superior filters, etc. The Yaesu, although slightly less expensive, offers apparently more controls.

Question 1: Does anybody have any first hand comparative experience of these two rigs?

Question2: What is the tuning rate on the Icom, (the brochure tells me everything except this critical function) and is it possible to change it?

The Yaesu offers a simple way to zero beat on CW, but the Icom does not seem to offer this, at least not on the top level controls.

Question 3: How do I zero beat with the Icom? (apart from flipping back and forth between CW and CW-R tracking for identical tones).

Question 4: What year were these two rigs first introduced to the market?

Thanks for any help.

Yaesu has done it again. This is a great radio. I love it. I have been using dual banders for a long time. I have come to the conclusion that I can only listen to one band at a time. This radio is simple and elegant. It can listen all the way up to 900+ as well as down to airband. It works great. Thanks again Yaesu.

This is a well-documented problem. I have a three year old Scout which exhibits the problem, and I do expect it to become at least a minor nuisance as my CW speed increases past the 15 WPM average I am at now.

Now, I know that Ten Tec has a stellar rep for service, so do you suppose that might mean, if and when they fix the frequency jumping in new units, they will offer (for a price I'm sure, but a fix is a fix) to rework old Scouts, or perhaps offer a new board that can be swapped for the old offending board? I hope so, and plan to nudge Ten Tec in this direction.

6464. QRN reduction on 160 meter (Tech Question)

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-16 00:00:00 UTC
From: W4NNG <w4nng@arrl.net>
Message-ID: <7k87cn$21f$1@nozzle.tacom.army.mil>
Source record: 105863

Hi Folks - Got any advice on this ...

To reduce static crashes on 160 meters I take 2 identical receivers that I have and connect them to a speaker with the phase reversed. One is tuned to the freq of station I want to hear the other to an adjacent part of the band that got no signals. This configuration does to some degree reduce the annoying sound of lightning crashes, but it doesn't stop the overload impact of the crash on the main receiver.

Sure would be nice to have a rig that did the subtraction at an earlier stage of the receiver.

Anyone know if any of these new dual VFO rigs, allow anything like this ?

Bob

Depends on how big of a battery you bring.

Then theres also the subject of the density of the radio. The
SGC-2020 (and other QRP rigs) is not nearly as heavy as
an IC-706 is. And the 706 will kill batteries quite fast, unless
you have a beefy battery and don't intend on operating for
long. Merely leaving the radio on for about 12 hours was enough
to kill my car battery....

Yes, yes,

the ICOM CI-V is public for example. But YAESU was to lasy to develop
a deacent i/o protokol and they are backing up the whole eeprom
instead, including the system area, interrupts, ... everything.

So, this is making everything possible, and it is understandable
that YAESU does not want to have problems with the FCC ...

So, no codes :)

6483. Kenwood TH-215A manual/help

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-17 00:00:00 UTC
From: rla@my-deja.com
Message-ID: <7kb0qf$kg3$1@nnrp1.deja.com>
Source record: 105695

I've got a Kenwood TH-215A, but managed to misplace the manual sometime over the last 10 years. Does anyone have a copy they'd be willing to copy and mail? Of course, I'll be happy to pay the cost of postage and copies.

Most of the stuff I remember, but can't recall if this model can be programmed for an offset that doesn't fall on a 100khz boundary. That is something nonstandard (like 610khz). Anyone have any tips??

Thanks!
Rob - N1GMJ

6484. Re: Icom IC-775DSP or Yaesu FT-1000MP

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-17 00:00:00 UTC
From: Johnny Rico <lawdog2@ibm.net>
Message-ID: <3768fbee@news1.us.ibm.net>
Source record: 105696

I spent several hours at HRO comparing the radios. I cannot honestly say that I can answer all of your questions, but here are my observations:

The ICOM's noise reduction system is continuous, whereas the 1000 MP has four pre-programmed positions for the DSP NR.

I liked the way SSB audio sounded on the 1000MP better. The DSP has 4 selectable filters which emphasize highs or lows, which I found sometimes really helped readability.

I liked the way that the 1000 MP's controls were laid out a LOT better than the ICOM's. In particular, I simply could not figure out how the ICOM's filters were selected. The ARRL review of the ICOM harps on this, and it is true.

After fooling around with both radios for several hours, I whipped out the checkbook and went with the MP. This was just one week ago. EMail me if you have any other questions. I do not work CW basically at all, so can't really answer your CW questions. RJB.

This is just what the various noise cancellers such as the MFJ-1025 do
but they aren't very effective on lightning crashes either because the
two sources are almost never 180 degrees out of phase nor are two
successive crashes ever phased the same. They can be very effective on
continuous noises such as TV buzzes and power lines, though.

Hi Ken and the Group,
It appears the Ft-100 still have a high failure rate. The IC-706 MK II G
may not have the high # in the QST reviews for the reciever performance but
they don't die out of the Box either. I sill would wait till the fall
to see if they fixed all the bigs out of this radio.Also, you don't get
disorted AM trasmit audio and little 10 mtr image problems. How can Yaesu
release a radio with so many problems and a high failure rate. They should be
ashamed of themselves.
take care, TIM

Johnny - I did the same exact thing two years ago and also bought the FT1000MP - the best purchase I have EVER made. I totally agree about the front panel layout on the Icom 775 . The FT1000MP also has an s meter for the sub receiver and you can use dsp to digitally vary the bandwidth on ssb (first step counterclockwise on contour control). My good friend K9WK just bough his 1000MP after selling his Icom IC765. He though the radio was broke until he came across a signal! He was amazed with the quietness of the receiver. --- Steve KK9ZZ

I know this is not much, and for all I know this could be in the later manuals, but there is no mention of this in my manual. To set ANY memory station as the priority, put it in memory mode, hold down the [FW] button for 1 sec., use rotary knob to get to desired frequency, then push [BAND] button. You will see a "P" beside the channel number.

6516. FT-290R power output? 2.5W or 25W?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-17 00:00:00 UTC
From: Will White <wcw@asu.uswest.net>
Message-ID: <3769E1CF.85EA0A11@asu.uswest.net>
Source record: 105728
Cross-posted to: rec.radio.amateur.equipment,Rec.radio.amateur.misc,Rec.radio.amateur.space,Rec.radio.swap

Trying to close a deal for a FT-290R, and the seller says his unit only puts out 2.5W, not 25W, in the high power setting. All of the references I have seen to the FT-290R claim a 25W hi power output on all model revisions. Am I missing something here? Was there a FT-290R that was only capabable of a max of 2.5 watts out?

Source record: 105729

I'm very pleased with my VX-5R. And unlike some, I find the antenna to be fine *on the ham bands*. Third party antennas seem to work better for non-ham reception.

I generally like Yaesu HTs (have owned the Ft-470, 51R, 50R and now the VX-5R). The VX-5R is the best of the bunch and the Li-ion battery technology is really hard to beat.

6518. Radio Mods for FT-920

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-17 00:00:00 UTC
From: radiomods@hotmail.com
Message-ID: <3768eaaf.2820149@news.earthlink.net>
Source record: 105730

I have the radio mods for the FT-920....not the software mod but the internal mods that will not hurt your radio as stated by Yaesu, the software mods were made for radios overseas which also use a different chip then the US Models, this software mod WILL cause damage to your FT-920 so you need the hardware mods, you can contact me by E-mail for mods for the 920 or other radios, just let me know the modyou want and for which radio , I'll see what I can do.

6521. Re: Enabling WARC TX/WTB Manual/ICOM IC-730

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-17 00:00:00 UTC
From: freqpolice@aol.com
Message-ID: <19990616201910.23278.00000552@ng-bh1.aol.com>
Source record: 105868

The instructions for WARC enable are on page 23 of the manual. You need to remove the covers, set the rig right-side up, and look on the left side of the rig as you face it. This is the RF Unit, and the 8 IF transformer-style inductors are the Band Pass Filters. At the front-bottom of this board you will see a metal rectangular box(the Double Balanced Mixer) and 3 more IF cans just above it. Two are kinda in line to the rear, and one to the front. Between the two to the rear you will kind a wire that is a jumper. It is this wire that you cut. And thats it. The cans, if they are labeled, are L30 and L29.

See you on 30m!

not
> recommended. Is this true, and why is it not recommended?

Many residential 110 wiring circuits will have difficulty providing
the ampreage required by the Clipperton at full power - regulation may
be poor.

>
> 2. What modes will it do and what power will it put out on all of
those
> modes generally?

It will do CW, SSB, AM, RTTY and similar modes. CW, SSB output is
about 1500 watts, AM is only good for about 200 watts reliably, and
RTTY and others, around 500-700 watts out.

>
> 3. Will it cover 160m-10m including 12m/17m with full output?
>
Yes - later model Clippertons will need to have the input circuits
adjusted for 17 meters - early ones had no tuned input, and the ones
supplied in later units were pretty worthless anyway...

> 4. Is this a generally good and dependable amp (especially in
contesting)?
>
SURE, as long as adequate cooling is supplied and recommended power
levels observed.

> 5. Is there anything else that I should know about this amp and do
you
> happen to know of a picture of it on-line?

I've had 2 of them, they are very rugged and reliable amps.

It's been a few years since I sold and repaired these, but...

> 1. I've heard that the amp will run on a regular 110 plug, but it's not
> recommended. Is this true, and why is it not recommended?
>
Works fine on 110.
It's a bit more efficient to run them on 220 as there is less voltage drop
in both the transformer and house electrical wiring.
Also as the PS uses a voltage multiplier instead of a full wave rectifier
any voltage drop in the 110 line is more noticable.

> 2. What modes will it do and what power will it put out on all of those
> modes generally?
>
On SSB and CW it will run the legal limit, or at ;east ,mine did.
For AM it wouldn't be as efficient as a plate modulated rig and it isn't
built for the long duty cycle of long transmissions usually found in AM.

> 3. Will it cover 160m-10m including 12m/17m with full output?

Yes and NO...It has the switch positions for 160 - 10 and most were modified
to go on ten. It only required removing a stop from the band switch.

There are no switch positions for any other bands.
Whether you could tune up on 12 and 17 using say the 10 and 15 meter
positions, I don't know. It would certainly not be as efficient as the tank
circuit would have the wrong Q on these circuits.
>
> 4. Is this a generally good and dependable amp (especially in contesting)?

Yes, *IF* it is given room for proper cooling.

>
> 5. Is there anything else that I should know about this amp and do you
> happen to know of a picture of it on-line?

The only short coming that I remember is the coax that goes from the band
switch to the TR relay. That was prone to shorting from melting due to over
heating. (It's a relatively small coax for the power)

>
> 6. About how much does one go for used in good condition today?

>is current-limited.

Most small standby UPS units are designed only to operate for
the time that their internal batteries will last. The transformer,
and the active device heatsinking, are generally inadequate for
longer duration use. For that you want a full time UPS, which is
generally bigger and much more expensive for the same VA rating.
But, if you restrict the load to a small fraction of the nameplate
rating, most of these standby units can be run for extended periods.

As to charging other lead acid batteries, the charging circuit is
a constant voltage circuit, and a nearly dead battery is about as
close to a short as several paralleled nearly dead batteries, so the
charging circuitry should be Ok for charging several gell cell batteries
in parallel. It will take much longer to bring several paralleled batteries
up to full charge, of course.

Hello,I have the following for sale.

1--Drake TR-3 with AC4 speaker/power supply.Works good but an alignment
would improve it.Asking $175.00.
1--Kenwood TS-511S with power supply.The radio is dead.The front panel
is a 9 of 10 this would be a good one to restore.Asking $100.00.
1--Icom IC-271H an all mode 100 watt 2 meter rig in excellent
condition.Asking $500.00.
1--Icom IC-471A an all mode 25 watt UHF rig in excellent
condition.Asking $475.00.
1--Zenith TransOceanic model 500 works good asking $100.00.
All prices are + shipping to lower 48.
Regards
Bob Stamper

You will need just a aditional 4 pole connector for the
Harware, you can find on my page for some FreeWare Software
for the FT50 or you can call RT Systems for the upgrade, the
upgrade is cheaper the a new package, 20$ or something like that.

Still have the following portions of my Superb Icom
Satellite Station for sale. Will sell separately or
consider offer for the entire package:

IC-271H ï¿½ 100 watt all-mode 144-148 MHz transceiver with
internal power supply, manual, hand
mic, internal pre-amp, and very rare UX-14 computer control
unit installed. Good condition.
$650.00 OBO shipped CONUS.

IC-471H ï¿½ 75 watt all-mode 430-450 Mhz transceiver with
internal power supply, manual, hand
mic, original box, and very rare UX-14 computer control unit
installed. Very clean condition.
$750.00 OBO shipped CONUS.

CT-16 Satellite Interface Unit allows any one of the above
radios to control tuning of another to
keep satellite uplink and downlink frequencies
synchronized. Like new. $100.00 OBO shipped
CONUS.

Hi Pat..

I bought mine right before Dayton, and have been pretty pleased with it, although the stock antenna leave a lot to be desired. It does ok on 2 and 440, but you'll need something different for 6 to get some performance. (I use the new Comet MHO-510, a 21" club-type whip) I've had good reports of TX audio, and the receive audio isn't too bad as long as you don't try cranking it way up. It's a versatile little radio as far as receive coverage. I listen to commercial FM stations on it at work during the day, can monitor the local police freqs, hook up a long wire and hear some great SW broadcasts. The early versions did indeed have some bugs, but those are pretty well fixed. Mine is an 9F series. The only problem I've encountered is some speaker howling on 440 with the volume about 1/2 way up. That was fixed by sanding off the paint around the screw holes to provide a better ground.
Otherwise, it is an impressive little radio. It can be easily modified to go out of band, but you need to be careful about where you transmit or you can easily pop the final according to reports I've read.
There is a mailing list at www.onelist.com for the VX-5R. Once you get there, do a search and you can have the latest postings delivered each day in e-mail. There are a lot of knowledgeable people there who can steer you in the right direction.
Good luck...shop around. Last I checked, Texas Towers and Lenten had the best prices, although I got mine from AS. Be prepared to shuck out around $330-$340 for the radio and that much again if you buy most the accessories like I did..hi.

73,
Dan / N9DRM

6553. Re: Yaesu FT-100, safe to buy?

From: Dave Rich <kgous@swbell.net>
Message-ID: <376ACA84.F15BBB44@swbell.net>
Source record: 105600

There are two people in the Kansas City area that own the FT100. Both seem extremely happy with there purchase. I continuously quiz them on how they like their FT100. They always say they love it. I then explain that on the internet news groups there seems to be many complaints. I even tell them some of the specifics. They report no problems.

Sorry to clutter up the group with this continued nonsense, too.

But if you've been her for any time at all, you will notice that I have NEVER initiated a "personal smear campaign" against this "Gerry Schmitt." It's Gerry who - for whatever reason - likes to attck someone with first-hand information and experiences to offer the group.

Why he has chosen me to attempt to "slur" is beyond me, too. I realize I should just ignore the ignorant remarks and move forward...but when he starts attacking the people and firms I deal with personally and professionally, I get a little defensive.

And, of course, Gerry balks when anyone asks him for actual proof or documentation of his wild allegations.

So...I again apologize for responding to his unwarranted attacks.

Sivert,

Please help me out here, how did I get involved? You're
responding to a post by Goran. I'm not fixated on the
codes I just like pointing out that you are a liar.
If you would like another fight I'll be happy to cite
all the inconsistancies in your posting history with
Deja citations etc.

Perhaps you remember such gems as:
The 800 number tech support
Your free upgrade which you later denied saying.

I remember well when you got into it with Goran and
said you were going to "write your own program" but
you couldn't get the codes could you? Based on you
panic calls to RT you look pretty guilty.

I tried to disengage but you seem to want to continue to
fight. What ever you want lazy boy.

6581. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-18 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7kcbub$2g7@news.Hawaii.Edu>
Source record: 105643
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I bought one and was very unimpressed with its performance out of the box on its stock antenna. The supplied antenna is a real dog and I've read many other posts with similar complaints. So be prepared to shell out a lot more for some better antennas. Out of the box performance in the ham bands, especially 2 meters shouldn't be a step backward. Shame on Yaesu for that.

I have for sale a ICOM W32A Dual band HT with the following accessories:

Speaker mic
Extra battery (NiMH)
Computer interface cable w/software
Carry case

The radio is in perfect condition used only a couple times out of the
protective case. I have the original box, manual and recipt.
I am asking 250.00 OBO for the package (split shipping)

This radio is really in great condition.....

Thanks

Hello Will,

The 25w output is optionnal on the FT series. In the Yaesu catalog, you
will find 2 references : 1 for the FT290R 'nude' coming with mic, antenna
and battery (2.5w) and another reference with the 25w amplifier.

Bye,
Philippe

I think ther were two ft-290 modles, the first was did have just
2.5 watts or so and the second, maybe it is the R modle or maybe it
has a II or mark II on the end of the 290 part. The second version
usually came with a amplifier that straps on the back to get to 25
watts. YOu had an option ot take it off and strap on a battery pack
and use the bnc connector on the front to get about 2 watts out

I've just come across, what appears to be, an old transmitter, in my late fathers junk box. The only markings I can find are "Harvey Radio Laboratories INC Cambridge, Mass and UHX-10. Inside seems OK - leastways no valves seem broken but there are no markings visible on them except 6L6 on one. Freq range according to a loose bakerlite plate (which may not belong to the set) is 5-160 meters. Anyone have any ideas what it may be or any details of the set.

Nat,

Great radio. I've had mine for just over a month and no complaints. Rig has very good noise reduction and internal amps to help on the weak signals. I find I use the dual watch for working the DX pileups and I'm hooked on the spectrum scope feature. The APF function makes CW pileups manageable. I'm not impressed with the scan function which only works well with very strong signals and no noise.

Like anything else, you don't know if you really like it until you use it. Too bad you can test drive it for a week.

Jerry

Cross-posted to:
rec.aviation.marketplace,rec.radio.amateur.equipment,rec.radio.swap,rec.video.satellite.dbs,sci.electronics.equipment

I have a few RF related HP test equipment pieces for sale.

1 - 853A/8558B Spec An
1 - 8590A Spec An with opt 001 (GPIB)
1 - 8656A Freq Gen
1 - 8444A opt 059 Tracking Generator

All equipment is in good working order. Recent expired calibration.
Manuals for most. Priced WAY below internet deal prices. For example, $8K
plus shipping would take the whole batch or trade for an 8920A with spec an
and tracking gen.

If interested, drop me an email. I will also entertain selling individually.

I have contacted Kenwood in the past and suggested that they put an archive of old models on their website, and they said they don't have any plans to do that in the near future. I can't see that they would object. If you had pictures of the older 2M and 440 radios you would have a great site!

Nice rig. I had one for about eight years, and really enjoyed it.
Excellent receiver dynamic range, good sensitivity, though you may want
to use a preamp for some applications such as satellite operation, etc.
I sold it when I got an IC-706 MkII, but wish I had kept it. (No slight
on the 706, but it's not on a par with the TR-751A for 2-meter
operation.)

73,
Jeff, KC1MK

Hi...

I'm selling a Non-Linear Systems MS-215 Miniscope Oscilloscope
on eBay. If you want to check it out (see a picture, view
the specificiations, etc), please follow this link...

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=118087588

This is one VERY small oscilloscope...you could fit it in a
briefcase if you wanted. Battery-operated, or external
power supply (included in the package.)

Thanks for checking it out...

CUL 73 de Ken N1NEG

PS Let me know if I can answer any questions about the unit for you.

Source record: 105481

I have had my VX-5 for about 3 Mo's now..... The radio works flawlessly in the Philly ~ New York area.. with very little intermod.

THIS IS NOT NORMAL FOR THIS RADIO, EVEN AFTER MODIFICATION.

The question really is, Do you live in the city, or by any towers? And, Have you owned any other HTs or scanner which have shown this symptom in your area.

If not, I would question Yaesu.. contact their tech support.

73's,
Homer

NOT normal; I'd get a new radio if possible.

Mine hears as good, maybe better than any HT I've owned.

Hi Larry,

I'm not absolutely sure, but I think it went something like this:

6SK7 RF Amp, 6K8 Oscillator/mixer, 6SK7 IF, 6SQ7 detector/1st AF, 6H6
noise limiter, 6V6 AF amplifier, 5Y3 rectifier.

Don't hold me to this... this is just memory from 50 years ago!

Bye-bye,
Keith

6633. Alinco DR605 reverse operation ??

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-19 00:00:00 UTC
From: Joe San Filippo <joe@zianet.com>
Message-ID: <376B9C2F.6CD0@zianet.com>
Source record: 105538

I have a new DR605 and find it will not transmit in the Reverse mode. I set the freq for 146.98 with - offset, then press the Monitor button. Per the manual, the receiver unsquelches, the displayed freq shows the repeater input, i.e. reversed, the flashing + appears, but the unit will not transmit. Am I missing something operationally, or does this sound like a defect?

Would you kindly respond by e-mail to joe@zianet.com?

Thanks.

5000 plus tubes. 7, 8, and 9 pin. loose not tested. I have been told, many, (some ?) of these where indeed not used. And were removed from water damaged boxes. I can not comfirm this, nor do I believe this to be true. I do know that many I've tried, for my own use have worked well. They are being sold as used, as is, not tested. They are not sorted, and I will not do so. I will not sell singles.
I'm asking $25.00 per 100 count. Or your best offer for all 5000 plus tubes. You pay all shipping cost. I will determand shipping cost, based on how many you purchase, at time of sale.
When responding, please state where you've read my posting.
Thank you for your time.

Big difference. Microsoft products can be fixed by downloading Service Releases. Try that with an FT-100.

BTW .. I know two locals who have FT-100s, and have heard of no bad reports. Of course they may not use them on bands where the problems indentified in posts here are an issue.

For example, my Icom 706MkII is flawed (e.g., PL is too high on FM, and no fix has been provided). But I only use it on HF (mostly 20 meter SSB), since I have a Kenwood tri-band FM radio in my car, too. So, for me, the 706MkII is a perfect solution for my mobile needs.

Just received my VX-5R the other day and all seems normal except the receive is very noisy. Programmed several frequencies in the VHF, UHF bands. There is a lot of pager intermod type noise. Has anyone else noticed this? This is with using the stock rubber (club) ducky antenna. Some others have reported that they have no intermod noise even in high RF areas. Called RT systems about this and they reported that its normal and I should set the CTCSS tone squelch to stop this, but this will also block most wanted signals. Any ideas? (Other than try another radio.)
Thanks, Randy, WB5KCM

Don't know why you'd say that. Most people who have said bad things about the VX-5R also own them and have spoken only of their experience with it. Its a real mixed bag. Some people may be willing to tolerate sub-standard performance as a compromise for the greater frequency range offered. The VX-5R can be improved with a substantial extra investment. Just don't expect it to perform as well as a traditional HT unless you make that extra investment. And if you want good performance outside the ham bands you are SOL. Better to invest in a scanner designed for that purpose.

It's about sixty bucks overpriced. There are other much more
sophisticated entry-level 2-meter HTs available...that also have more
power, too.

If you insist on low power <grin>, you can get the Alinco dual-band
credit card radio for the same price.

If it's 2-meters you want in a good HT, I would rather you spend your
money on, for example, the ADI HT - where you get an awful lot more for
your money!

6648. Sending JPGs to this list

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-19 00:00:00 UTC
From: tevans@interaccess.COM
Message-ID: <4.1.19990619123715.03d47d20@pop.interaccess.com>
Source record: 105553

More and more frequently this list contains attachments in the form of JPGs, GIFs, etc.

When I get a digest which has JPGs, it takes considerably longer to download the email. It also takes about 10 seconds to open the email to read it. (Your mileage may vary.)

This poor ham would prefer if emails containing JPGs were not send to the list, but instead included a comment like "You can see a picture of my ... at http:/www.mysite.com/" or "Send me a direct email if you would like a photo"

Seems like this would be more efficient for everybody.

Any comments?

Thanks for listening, Tom AG9X

Tom, I would prefer that everyone that had something for sale post a
picture of it when they list it. You would have to be in an awful hurry
to worry about something that you were interested in taking 10 seconds
to download.
Thoes who list pictures with their message might start it off with:
FS/PI For Sale/ picture included :-)

I have a DSP-100 for sale. It is made for use with the TS-850 and TS-950S & SD. It is in new crisp as new, condition 'cause it is. The super senior that bought it retail has decided that due to the code requirement he started too late & before using his equipment, its for sale. Hence, you get it BRAND NEW, for a used price! It comes with all four spl. cables. I am told this unit is currently being sold for $799. at "certain" retail stores. This one is for sale @ $385. It's value will go up I believe, like some other pieces of the same era. Ben Piller, K9CSM Strasburg, CO Tel: 303 622-9503

Source record: 105563

I have a 10w icom 290a 2m all mode mobile for sale. I do not have box or manual but radio is VERY easy to operate. I have not used it in over a year and it's just sitting here so I've decided to try and sell it. It's a good rig have made many QSO's with it. I'm sure I'll regret selling it about a week after :-)

I'm asking $275 OBO + S/H

Please reply via e-mail to wxspter@aol.com

Thank you
Robert AB5EW

The truth is not "out there" it's right in front of us.

6659. Re: Icom IC-2710H Mods & Thoughts?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-19 00:00:00 UTC
From: wr1q@ziplink.net
Message-ID: <YNSa3.563$Ly.41497@petpeeve.ziplink.net>
Source record: 105564

I have one in my car. I have found it to be a good transceiver. I especially like the ability to monitor 2 VHF or 2 UHF freq's simultaneously.

There is an extended freq. receive mod and a cross band repeat mod that I'm aware of.

6661. Do Heil mike elements go bad?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-19 00:00:00 UTC
From: Joe Schlatter <joe@schlatter.org>
Message-ID: <7kgr65$2e3h@enews4.newsguy.com>
Source record: 105566

I have a Heil headset with the HC-5 mike element. I have not been on the air for over four years, except for an occasional CW contact. Tried to get on 20 phone this afternoon and the Heil mike does not put a single shred of audio into my rig. When I pull off the Heil and use the regular station mike, things work just fine.

Four years ago when I packed it all up, the Heil worked.

Do these elements go bad? I opened up the mike and it's just a single element with two leads so i guess I can purchase a replacement and replace it.

hi all....
i have just bought a ts-940s and was wondering what your
opinions are as to which desk mike i should use with it to achieve
really nice "STUDIO" audio. i prefer the audio to have more bass than
treble but it must be real clean.

i have a kenwood mc-50 which i was thinking about using with it.

anyone know how well this mike matches/sounds on this radio ?

any help on this matter would be much appreciated.

please email me ..
thanks.

Had the same thought. Might even buy one if it's on sale. You can always
use another radio right?

This brings up a thought I have had for a couple years: do you suppose that ham companies that are still in business might have promotional literature laying around from models long out of production? It might be valuable to acquire that stuff, as the quality of their photos is liable to be much better than most of the JPEGs I have seen on the net.

John Donnelly wrote:

I have like NEW four SABER handhelds. These where not used. Absolutely brand new condition. They are the 440-470MHz. They come with antennas and 13 new Hi Capacity Nicad Batteries and a one hour Sixpack Charger. These radios have the longest range I have ever tested in handheld communications. They have 12 Channels. Model number is H44QXN7139CN. They have the switch for securenet but I'm not sure if they have the option. I would like to sell the complete set all included for $1250 shipped firm no trades. If you have a need for reliable communication using the most durable radios this is an outstanding deal.

Tell me how would you propose I "prove" you made a
phone call perhaps you would like to "prove" you did
not make calls requesting the command codes.

I give up Clint it is obvious you will never admit you tried
to get those codes and I don't really have the time or inclination
to argue with you further.

My mistake was to expect any vestage of honor or honesty
from you. My apologies to the group for persisting.

From: gkschuler@my-deja.com
Message-ID: <7kjled$p1g$1@nnrp1.deja.com>
Source record: 105438

I have bought an VX-5 yesterday.
Spent the whole day to get familare with the operation. All worked fine, except programming in Memory Mode different RX and TX frq (Odd Splits). Following the instruction in the manual (under Storing independent Transmit freq), I was not successful, finally I had allways the 2. entered Freq. in the memory (simplex).

Can anybody give me more detailed infos on the subject.
It is a little bit urgent, as I will leave on the coming Thursday for the Philippines, and I would like to use that function during vacation.

Thanks

6704. Digital Tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-20 00:00:00 UTC
From: Elvis <0abyss0@geocities.com>
Message-ID: <376D69A3.1ABB6CE5@geocities.com>
Source record: 105446
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi,
I'm looking to build a digital tuner -- compact in size (circa 1.5"x3"x3") [thats HxWxD], with a standard Motorola antenna input and a female mini-plug output. I'm planning on using this in my car and connecting it to my car-kit (a permanent connection)-- the tuner thats in the receiver right now is an analog one and isn't very good. I don't know if I would need to include some kind of amp in the tuner -- so, perhaps that would be something one of you could help me with. I want to make this as inexpensively and with little hassle as possible (i have... well, no real electronics knowledge). If any of you can help me out and/or point me in the right direction that would be greatly appreciated.

6705. A littl more help on duplexers

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-20 00:00:00 UTC
From: Dano <webster@express-delivery.net>
Message-ID: <7kjbnu$9qt@nnrp4.farm.idt.net>
Source record: 105447

O.K. , I'm on a roll. Went to the "MIT" flea market & found a
??"duplexer"???
It has 6 square tubes mounted together, about 2-1/2 ft long, rec,trans,& ant
ports.
On the other end, each tube has 1 adjustment screw.
So I'm told by one of our local hams, I should go back and buy the bridge
the guy was selling also, cause what I bought is "JUNK".
My question is > will it work good enough for a business band repeater with
5 mhz split.
Dano
P.S>
in case anyone wondering, the factory tag was marked for 154 mhz in, 159mhz
out.
& the make is a Phelps dodge.

There are no easy answers...

You will have to re-tune each cavity for YOUR frequencies.
What makes me uncertain is if you are asking these questions,
you probably are not equiped to handle such a job.

Phelps-Dodge never made "Junk".
I fail to see what connection there is between a bridge and the duplexer.

Source record: 105457
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Can anyone recommend an inexpensive 2 Meter SSB transciever?

Other information helpful would be a used radio source that often has VHF SSB radios, or a source that has kit radios of this type.

Any help is greatly appreciated. If possible, e-mail and post your response.

6723. FS: ICOM IC-701 HF Rig and PS

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-20 00:00:00 UTC
From: do-not-send@junk-mail.com
Message-ID: <376d47ae.434612757@news.tde.com>
Source record: 105491
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I'm selling my ICOM IC-701 with matching power supply and original desk microphone. Rig is in working condition, includes all manuals, schematics, original packaging, etc., etc.

The unit does work, and there are no known problems. But... I think could benefit from an alignment. ICOM service and support referred me to someone who indicated he'd charge $25 for that, plus shipping, so factor that into your decision.

This was a popular little rig when it was new, and it's still a decent little unit today IMHO. But it's not getting the use it deserves, and needs a new home. It performs well on CW and SSB.

I'll happily respond to questions via e-mail to: ic701@hotmail.com.

I'm asking $350, but I'll consider other offers. Price does not include shipping.

Alan Bryant, Nï¿½SBM, Denver, Colorado

6724. VHF yagis and jpoles...cheap!!

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-20 00:00:00 UTC
From: n8wwm@aol.com
Message-ID: <19990619220953.14562.00000906@ng-fl1.aol.com>
Source record: 105492

I custom build <1 at a time> some darn nice 2 meter antennas!

3 EL Yagi-30.00 These are all aluminum, gamma fed, nice looking and
working
yagis...The Jpole is all aluminum, goes together
in 2 shakes,
4 EL Yagi-37.00 and is 3/4 wavelength long. These are excellent antennas,

and have sold out at local fests and club
meetings each
5 EL Yagi- 43.00 time I bring 'em.

Jpole<3/4 wave length>-23.00

Each antenna comes with an instruction sheet and all hardware to have it up and running in minutes. The yagis have gamma rod assembled and attached to the driven element. The Jpoles come with pre-drilled set points for tuning at 3 points in the band.

I am not some web scammer, I just like building antennas. You can reach me by this email address, by my call book address, or by sending a note to my call sign at PO Box 2189 Schiller Park, Il 60176.
Chicago area hams may arrange for local pickup.
SHIPPING IS $8.50, regardless of antenna. I will ship 2 of any one for $11.00.

INCLUDE YOUR EMAIL ADDRESS IF YOU ORDER BY MAIL...Checks or Money order payable to Doug Adair only...this is not a big business...I am just having fun and helping new hams not GET RIPPED OFF!

Thanks guys...73 and CU on 6 METERS!!!!!!!!!!!!

OUT LIST......TRW swapmeet is on the last Saturday of the month
6/26/99. TRW location is Aviation, and Marine Blvd. in the city of
Manhattan Beach 1 mile west of the 405 freeway. Time is 7:00- 11:00 AM

HERE IS THE LIST>>>>>>>>>>>>>>>>>>>>>>>>

I have alot of Kenwood stuff:

I have KENWOOD YK-88C 500 HZ CW filter 4 sale, and they will fit in
these
models..
TS-120S
TS-130S, SE
TS-180S
TS-430S
TS-440S
R-5000
TS-530S, SP
TS-830S
TS-670
$69.00 shipped in the US NEXT...........

4 Sale Kenwood VS-1 Voice Synthesizers .
These units will fit in these models.........
TS-940S
TS-440S
TW-4000A
TR-751A, & TR-851A
TS-711A, & TS-811A
TS-670
R-5000
$79.00 shipped in the US NEXT.................

Kenwood IC-10 interface, and IF-232C interface unit both
for only $99.00 (hard to find combo)

(2) YK-88SN $69.00 shipped
(2) YK-88A $69.00 shipped
(10) TU-4C for TW-4000A $42.00 shipped
(1) TU-3A for TM-201A, and 401A $42.00 shipped
(2) TU-6 for TH-21,31,41 $42.00 shipped NEXT..............

The R-5000 are "IN" the price is $439.00 shipped in the US

Kenwood R-5000 RECEIVER
IC 10 interface

IF-232C interface
YK-88C 500HZ CW filter
and custom rack mount, with external speaker, and manuals included.

Got some Collins stuff 4 sale.....

1. (2) Collins 189A-1 phone patches for a KWM-1 $99.00 each.

2. Collins 310B-1 exciter with coils for 10,20,40,80,160 $295.00
looks good.

I have (2) TWO Collins Winged S-lines 4 sale they are both good to
very
good, and original.

3. Collins 75S-3 Receiver
Collins 32S-3 Transmitter
516F-2 power supply
copies of the manual...$1100.00 shipped in the US

4. Collins 75S-3 Receiver
Collins 32S-3 Transmitter
516F-2 power supply
copies of the manual...$1100.00 shipped in the US

Bird 8201 500 watt dummyload $150.00
Bird 4381 RF Power Analyzer sells new for over $1000.00
ONLY for $299.00

Hammarlund HQ-129X nice condtion $150.00

Hi All,

I recently bought a used Kenwood TS950SDX. I am missing a few
items that one of you might have. I am missing the RM-1 Keypad. The
recording & playback feature cannot be accessed without this (The
DRU-2 was already installed). If you have one of these to sell, please
E-mail me.

Also, in the accessory list on page 6 of the instruction
manual, there are a few things listed that possibly one of you 950SDX
owners could scan, and E-mail to me. They are:

Control location sticker
External control instruction manual
Menu key display list

Thanx & 73,

RON.....KA2IIA

I bought one at Dayton this year and I love it too. Sometimes people ask why buy this rather than the 746? Aside from the better receive specs, the dual watch feature is wonderful. When working DX operating split, you can listen both to the DX and the person calling at the same time. No more pushing a TF-SET button to listen on your transmitting frequency. The difference this makes has to be experienced to be appreciated.

The other thing I really love that hasn't been mentioned is that this is without a doubt the finest shortwave receiver that I have ever owned. The bandscope may seem like a toy (albeit a fun toy), but for listening to shortwave stations on a crowded band it is really helpful. You can cut in a narrow AM filter (stock, not option) and then tune the AM signal off to the side. The signal is perfectly copyiable with reasonable fidelity and the interferenced is sliced off. It makes SWLing a pleasure.

The three antenna jacks are also really nice.

The operation of the controls on the front panel is very intuitive, I really didn't need the manual to get started. My last radio was a 706 and while its nice and small it is so small that it is difficult to operate because relatively few controls could be fit on the front panel.

Bottom line: In 30+ years of hamming, this is the finest radio I've owned. Maybe someday I'll be willing to spend $4K on a radio, but until then, this is it.

John, W2FS

>to download.
>Thoes who list pictures with their message might start it off with:
>FS/PI For Sale/ picture included :-)
>K5JOE

Joe, That's a good perspective. I guess I'm interested in only about 1
percent of the things that are listed, hence my impatience with the rest of
the items.
As for the 10 seconds, that's how long it takes to open and display a
Ham-Equip Digest when it contains one JPEG. as compared to about 3 seconds
when there are no pictures. (That's on my 166 Mhz Pentium, so I know that
could be part of the problem.)

Mr. Bradford,

You have repeatedly demeaned and insulted myself
and others on this newsgroup. I just don't take it.

You did indeed make phone calls in an attempt to
gain propriatary information related to programming
Yaesu radios. You know you did this and I know it.
Why you are making such a big deal out of it is beyond
me. You tried to get them you couldn't so what.
Or is a public admission of failure impossible for
you?

I have wondered for some time why you called yourself
"Clint" when your name is Sivert but recently I have
come to understand.

I can just see you sitting at that desk looking
everyone straight in the eye and stating in you best
offended tone, "I did ask for those codes." Now it
all becomes clear you have taken the name of your
role model.

AGAIN: 100 percent false, Gerry. Absolutely un-true. And, of course, you never seem to cite any proof of this silliness.

> I have wondered for some time why you called yourself
> "Clint" when your name is Sivert but recently I have
> come to understand.

Let me look again at my birth certificate...NOPE, you're wrong. My middle neame is, indeed, Clint. That's what I have been going by for the past 44 years. Do you have a problem with that, too?

AND AGAIN, you refuse to address the six allegations you made in this thread.

ggs@my-deja.com wrote:

>I just can't wait to see how you misquote me this time.

I feel compelled to set the record straight...just in case anyone here just might be reading Gerald's tripe.

Let's quote Gerry directly on six "points" he alleges in this thread alone:

1. "A public statement by RT that Bradford etal do not represent their firm would go a long way toward repairing the public relations damage he has done."

2. "Your bullshit leaves such a bad impression that it is actually hurting RT Systems."

3. "I had a nice chat with RT Systems apparently you are a bit of an embarassments to them but there is little they can do about you."

4. "The other things I learned gave me a lot more insight into your real motives. It is certainly strange that someone so supportive of RT Systems and the ADMS software would want the command codes for the Yaesu radios. That looks more like someone who intends to produce a knockoff rather than someone who supports RT Systems and the ADMS software."

5. "It is apparent that what you really want to do is to produce your own product it was all quite interesting. You sir are a liar and a fraud and are simply trying to divert attention from this."

6. "...that it was obvious you wanted to develop a competitor to ADMS. Or perhaps you just want the Yaesu command codes to be a big shot. Why don't you just figure them out like Goran did. Perhaps you're just too lazy and unmotivated as we have previously discussed."

Gerry: You cannot use Karen nor Rod at RT as your "source" for your accusations. As a matter of fact, you cannot provide the name of ANY principal at RT Systems who will back you up on any of the above.

If you could - you would have by now...

You cannot provide legitimate copies of anything I have
ever written asking for "codes" for anything. Nor can you demonstrate
any interest of mine to get involved in any such project in ANY
forum/medium.

If you could, you would have by now...

I do not know why you invent such silliness, Gerry. But it's
quite boring, actually.

And, just for your enlightenment, Gerry, I will sign this message:

I've had one for a while now and really enjoy it. The fish finder is great
in crowded band conditions when looking for that sliver of clear space.
Receiver is very quiet.

Tony Heatwole wrote in message ...

I bought one at Dayton. First thing I noticed while using it on the way home was intermod while near downtown Indianapolis. here at home (Danville IL) that hasn't been a problem. I just remote mounted it yesterday. I'm very pleased with that. It's a good rig, but not without faults.

One would think so. But imbedded micros frequently have a date/time function that is unused and set at the factory (far cheaper than making micros without date/time capability). These just might be the biggest problem with Y2K. A few months ago I saw a soda machine (also without visible means for setting a date or time) locked up when it hit the 99th day of '99. It rolled the price of sodas up to $100.00 and would not allow any change. It made me put together contingency plans for all electronics I will need after the first just in case. Good luck.

Andy & group,
This is a neat idea. I have to overhaul the shack in the next couple of weeks, and I was planning on cutting a 3" hole in the wall, inserting 3" dia PVC pipe and running cables and ground through the pipe.
The SO239 in the faceplate idea sounds more elegant, but I am concerned that all the added connections might increase losses. Does anyone think that's true, or would it be so minor as not to matter??????

Depends on frequency. Estimated loss per connection is 1db. I don't
have any figures on this but I would imagine that would be much less at
160 meters than 440 Mhz. I think if you used silver/teflon connectors
that may improve.

I made up a setup on my station for grounding similar to that. My
station is setup on one of these pre-fab pressboard type computer desks.
I took two 1-3/4" X 7" aluminum plates and drilled them to fit the UHF
bulkhead connectors. I put one plate on the outside of my desk on the
side nearest where the feedlines come in and lined it up on the "inside"
of the desk. I then drilled 6 holes through the plates and the desk and
inserted the bulkhead connectors and tightened them down. I put quick
disconnect ends on each of my coax lines coming in to the house and
connected jumper leads from the inside of the desk to each radio. I
purchased a ground buss that had 6 SO239 grounded connectors on it and
attached it right above the feedpoint. Now when a thunderstorm comes up
suddenly, I can disconnect and ground all antennas in a matter of a few
seconds. Its also easy for my wife to do that after I showed her how.

I probably have some additional loss with this arrangement but I am
willing to accept that for the grounding protection I am getting.

Yep:

Received a number of Motorola T1504 and T1502 Series UHF Duplexers in Excellent condition, complete with all Cable, Knobs, and supports. Designed for Rack Mounting, and will handle 100Watt + with ease. Will supply some extra RG142/BU Cable for optimum performace and isolation, along with all support documentation. Will also tune it to your Frequency.

This is a Band-Pass / Band Reject Series Duplexer, and will handle up to 250 Watts with 100db of isolation. All have been tested against Flash-Over which can be fatel to duplexers........

Asking $350.00+$20.00 for shipping and handling (4 cavity Models) or $175.00 for the 2 Cavity Models
==========

If size is a problem, and you desire something a bit Smaller, I have some TLD7407 Series Motorola 6 Cavity Band-Reject Duplexers, and will supply them with the same features as above. (Made for Motorola, by Celwave)

Perfect for those 25-50 Watt Repeaters, and you do not have to worry about lugging a huge Duplexer arround for a 25 Watt Repeater.

Asking $195.00+$8.00 for shipping and handling

Terms:

Acceptable PrePayment in the form of a Postal Money Order (If immediate shipping is desired) or a Personal check is A-OK too if you do not mind a short
delay in shipping for bank processing.

Monty

From: Jacquis <jaclyn@tiac.net>
Message-ID: <7kl8qr$rr@news-central.tiac.net>
Source record: 105384

Got a processor board for my FT101EE. I can match up the colors from the harness to the board, simple enough ! After doing this there were two pairs of wires on the radio harness (white/yellow & white/gray soldered together the other pair white & red soldered together) Looked like the bypass loop for the rig when it ran without the processor option. Unsoldering these resulted in matching up the white/yellow, white/grey and red wires to those from the board. Now I have a white wire left ! There was no white wire from the board I bought and I was wondering where this wire will call its new home on the board. With just the operators manual I am a little lost since it does not mention the upgrade proc. option installation. It seems the white wire has around +12v on it and the board has a white/orange going to the +12v terminal on the board. The way it is now the unit allows the rig to modulate but without any processing so It must be ok for the most part (since the op-manual describes the circuit as an amplifier in the proc/off position). It does this (but with increased ALC sensitivity) so I am close but no better than without the board. Has anyone installed one of these or can see where the white wire goes to on the pro. bd. in their rig? There is that white wire with a very faint yellow marker connected so don't let this be confused with the plain white. Appreciated any help ! Jacqui N1DVE jaclyn@tiac.net

You could always take a metal blank wall plate, drill it or punch it
out, and use an SO239 bulkhead. Then take a standard PL259 and feed it
in the back side through a standard electrical box.

Hi there. I'm an electronic musician seriously searching for the
following old electronic musical instruments from 1960-1990,
any condition, broken OK:

Synthesizers
Keyboards
Drum Machines
Sound Modules
Effects Processors
Analog Sequencers
Analog Modular or Patchable Synths

Roland TB-303 Computer-Controlled Bassline
Roland MC-202 Microcomposer
Roland TR-909 Rhythm Composer
Roland TR-808 Rhythm Composer
PPG Wave 2.3
Yamaha TG77 Tone Generator
Casio VZ-10m Professional Digital Synthesizer

Moog, ARP, Korg, Roland, EML, EMS, Buchla, Serge, Yamaha, Aries,
Sequential Circuits, Oberheim, Steiner-Parker, Polyfusion, Emu,
Wavemakers, Synton, anything similar!

In general, I'm looking for old stuff with knobs, sliders or especially
built in patchbays. The older or more unsual, the better!

For a better idea of what I'm into, please see:

http://members.aol.com/rolandman1/index2.html

If youve got anything or know someone who might, please email me
privately at rolandman1@aol.com and be sure to include price and
condition. Thanks in advance and apologies if this message bothers
anyone.

Steiner-Parker Modular
Steiner Synthacon
ARP Sequencer
Tonus ARP model 2600 Synthesizer

>that I can use to enter my everyday qsos and import contest logs is
>some common log format, like REG1TEST or ADIF.
>

Hi Tapio,
You can try my program Easilog from http://come.to/g0mdo.
It covers all (UK) bands from 160M to 24GHz.
It has:
Off-line and on-line logging
Log import from contest logs and ADIF.
DXCC country tracking.
On line database search and update, good for WAB, US Counties etc.
QSO comment search and print. I use this for tracking IOSA by putting
IOSA in the comment field and other keywords for any other tracking.
The log can also be printed by country.
LAT/LONG to Locator.
Locator to Locator Range and Bearing (on-line).
Many other useful facilities.
It's a DOS program, it free to try and $8 to register.
Best wishes
Don Ward G0MDO

I bought the 207 for Christmas this past year, and am very pleased with its operation. The only problem with it is you can't receive on both bands at the same time. If that's not an issue for you, by all means, It's an excellent rig. It's small, compact, and very versatile. 73's, Nathan KA3MTT

Scott;
The mods that you have made are most likely the best that you will be
abel to do with this radio...
I had a IC-706 MKII in operation from a fully COOLED eqpt shelter
(Constant 70 Degree F) and the "fan" went on and off every 3-5 min just
siting "ON", at one time I attached a temp sensor and it showed the
case to be at 89D F.
I think that this "Micro Radio" was not ment to be a QRP "Dream"

Ahh but if you don't have the right date you'll only be able to talk with spark gap transmitters when 1/1/00 is thought to be 1900! <grin>

If you use PAKET as I do you can have the date reset from the computer everytime you connect to the TNC. Works fine for me.

Hi Louis, Hi Andy,

Andy's bulkhead/faceplate idea is very workable, in fact we did nearly exactly that on a broadcast installation many years ago where they still insisted on running video around on PLs...

The only thing I would mention is to use standard plastic faceplates rather than metal ones; that way won't be inadvertantly connecting the signal ground to house AC safety ground when they're screwed into the wall boxes, which could cause all manner of problems.

Source record: 105396
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Complicated and possibly stupid question: I have a C74MSY repeater that was donated by a friend, and I'd like to tune it into the 440 band. It's one of the much older models and looks like it could possibly be crystal-tuned. Anyone ever dealt with one of these? It's a large rackmount unit with separate exciter, receiver, controller, and PA modules.

Yes, I know, I really should be using a VXR5000U or something else from this decade, but I'm broke and have the choice between this freebie or nothing at all, especially since I still have to find a tower site, duplexer, bandpass and preamp, etc., etc. Please email any (polite! ;-) suggestions to KD5BIV at mailto:lihan@ccwf.cc.utexas.edu .. tnx/73

Christopher,

If one can be found a Kenwood TS-700A would be a good choice. Have
you considered one of those Ten Tec 2 meter Transverters? They can
be had in kit or built form. They require a 10 meter signal source.
You could easly use a modified CB radio or one of those "export"
jobbers for the exciter. Simply hook the two together and you are
on two meter SSB. CHeap and simple.

What do the field day rules say? Can you turn off the fan and use
an external fan to blast air thru it? You've already turned off the
lights,
so you need external light to read the display. Why not do the same
with the air.
Disable the audio circuits and use headpones. Might pull out a few
more ma.

The units are OEMed in Korea for RS. The radios seem OK, but are way overpriced, as most of the items Radio Shack carries are. For a lot less money, you could get a micro-powered HT from a real ham store that would have a lot more features. Or, for about the same money you could get a real 5-watt HT.

The HTX-202 was the same, in my experience. The unit was based on a 10+ year old Icom design, it only had 10 memories, and it was missing great features like wide receive and auto repeater offset. Plus, it was priced slightly higher (in it's heyday) than a typical full-featured HT made by a REAL ham radio manufacturer.

So, why would anyone buy a RS unit? If you want to buy a radio, get it from your local ham radio store. Without your support, your local ham store won't continue to exist. Let Radio Shack sell cellular phones.

6830. Re: VX-5R Noisy Receive.

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-21 00:00:00 UTC
From: Randy, WB5KCM <wb5kcm@hotmail.com>
Message-ID: <7kmdhhncf1@nnrp1.deja.com>
Source record: 105423

Some additional findings on the VX-5R with noisy receive.
With some additional checking it looks like the problem is only on
these frequency ranges: 120 to 139.995 and 150 to 299.995 Mhz. When you
switch from 299.995 to 300.000 Mhz its like turning off a switch all
the noise goes away. Also I found the pager transmitter frequency that
seems to be causing most of the problem, its on 152.005 Mhz. This pager
is extremely strong and I have this same interference problem any where
I travel in and around the city of Houston. No other radios have this
problem and I do not have any problem on any other frequencies with the
VX5. This is using the rubber duck antenna. Seems like a strong signal
in the 150 Mhz range will capture the receiver completely in these
frequency ranges and no matter what frequency you dial you will only
hear the interference signal. It seems like a strong signal will
saturate the frontend very easily.
Any comments will be most appreciated.

Thanks for the reply - not quite - two meters on the top and three
rotary switches below. Actually A further search in the same junk box (
large sea chest actually - my father was a lighthouse keeper) revealed
an old ARRL book dated 1937, in it was an advert for "Harvey High
frequency radio transmitters (catalogue number 51)" and low and behold
the UHX-10 transmitter is listed. I quote
"Due to its wide frequency range (5-160 meters)..... a compact low
powered transmitter.
The oscillator is a type 6L6 which may be run pentode connected for
operating straight through on the crystal frequency, TRI-TET connected
for frequency multiplying as high as the forth harmonic of the crystal,
or electron coupled when crystal control is not desired. The output of
the oscillator drives a second 6L6 as the power amplifier. This latter
tube runs always as a straight amplifier, never as a doubler. For 100%
modulation of the 20 watts input, a 6N7 furnishes 10 watts of audio
power to the plate and screen of the power amplifier while a second 6N6
acts as the Class B driver. Microphone input is fed directly to the grid
of this tube. ..... transmitter is designed so that it maybe
powered either by an AC supply or 6 volt dynamotor. "

There also appears to be a version UHX-10R for use in automobiles/trucks
etc.
Other Harvey radios listed are:-

700-R power output 250 watts telephone 700 telegraph
200-R .. .. 60 .. .. 200 CW
80-T .. .. 18 .. .. 80 CW
UHX-35 .. .. 35 .. .. 35 CW
200-S .. .. 50 .. .. 50 CW MCW
60-S .. .. 20 .. .. 20 CW MCW

All very interesting - the ARRL book as well - once again thanks for

hi Om,

The uhx-10 was a 10 watt CW, AM and MC transmitter made by Harvey Radio.
There is an article and schematic in QST 1937 on this unit as well as some ads.
Suggest you contact Richard Brunner--
rbrunner@gis.net who owns one and can give you the QST month and page.

6842. Generic logging program for VUSHF?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-21 00:00:00 UTC
From: Tapio Sokura <oh2kku@iki.fi>
Message-ID: <376D9825.CEEE6705@iki.fi>
Source record: 105466

I'm looking for a generic type of logging program that is designed to be used on VHF & up. I'm not looking for a contest program (although it doesn't matter if the program can do contests, but it MUST be usable for "normal" logging). Instead I'd like to have a nice program that I can use to enter my everyday qsos and import contest logs is some common log format, like REG1TEST or ADIF.

The things I mostly need are statistical, the program should keep me up to date on the countries and grid squares I have worked for each band separately (& together). Preferably it should also have a way to store and do statistics on user specified "variables", like Finnish counties (identified by a 3-digit number). Some sort of QSL managment would be nice too, maybe even rig control for reading the freq and mode automatically (FT-847). Also free form QSO input would be nice, like Taclog has. Is there a such program?

There are nice generic programs oriented for the HF operator, but many lack in VHF & up features, like grid square statistics or the possibility to enter propagational data (es, tropo, aurora, ms...) without using some generic note field, that can't be properly indexed or made out to statistics. I don't mind paying for a good program, although for example the price of $129 USD for LOGic is a bit steep, or then it has to be a very good program. The program should work in dos, windows 9x or linux. And work well on a 486/low class pentium machine, I have seen some windows logging programs that take forever to do anything on a p60 with around 20 mb of ram.

Unfortunately, the newer AT-201 sells NEW for within ten bucks of this price.

See if Danny really needs the cash right now. If not, he could donate one to his lical middle or high school amateur radio club, and claim a tax deduction at tax time next year. (Ask a tax attorney for details.)

You will also have fun if you try and wire a mobile mic up. Its not that
simple as the PTT runs on seeing a particular resistance as there are
loads of controls in the mic as well! Pager probs here on a friends one
as well. Seems to work OK in all other respects.

I am researching the Y2K compliance of TNC's, as well as the impact of Y2K on the packet system. Our local packet users want to have all remedies in place before the end of this year.

I require the following information:

- Which TNC's are Y2K compliant?
- What impact will users of non-compliant TNC's experience?
- What must our packet network do to prevent any problems?

I shall contact the manufacturers of commercial TNC's, but I may miss some brands. Your input will be appreciated.

Regards
Deon ZR1DQ

6855. IC706 - how to lower receiver mode current?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-21 00:00:00 UTC
From: ka9p@aol.com
Message-ID: <19990621071908.15622.00001156@ng-ft1.aol.com>
Source record: 105479

I'm planning on using an IC706 on Field Day next weekend using a 10 D cell battery pack. (the Duracell chart give me about 4 hours as I read 'em with the 1 amp receive mode current and 30 % duty cycle 5 watt output transmit, but the battery life seems to increase dramatically as you minimize the steady state current drain). I've lowered the receive current draw from about 1.5 amp to about 1.1 amp by turing off the LED illuminator, and can squeeze another 100 mil current drain or so out by unplugging the fan, which I hope will be ok at 5 watts PO. Does anyone know any other ways, easy or hard, to reduce the receive current draw on this radio to extend the battery pack life?

Thanks, Scott

Scott

If the ambient temperature is more than 7-10 degs, the internal cabinet
temperature will be too high if the fan is disconnected. This is even if
used just for RX.

Mike:

Just went through the same analysis and bought the Icom IC-746. First, is Icom's product support. It is the best in the industry.

Second is the design. It's got much more filtering in a quad conversion design compared to Yaesu's dual conversion. The DSP is also IF on the icom vs yaesu's AF DSP.

Last is the 2 meter multimode rig built in. It's 100 watts output on 2 meters, with PL encode/decode/tone scan/call channel, etc.

I also like the dual passband tuning in the IC-746. You can shift the 9 MHz and 455 KHz IF passbands seperately which results in variable bandwidth tuning, or IF shift (like tone control). This performs as good or better than the slope tuning in my TS-940S/AT!

I also suspect that icom is working on RS-746 software to allow control of all the rotary encoder functions remotely?

Audio reports have been excellent with the stock microphone, and it sounds good on receive too.

The antenna tuner works on 6 meters...used that last night! If you're into CW, it has a built in memory keyer.

All in all, I'm quite impressed with the rig!

Prove your allegations, Gerry.
Where's your answers to these charges?

GGS> I just can't wait to see how you misquote me this time.

I feel compelled to set the record straight...just in case anyone here just might be reading Gerald's tripe.

Let's quote Gerry directly on six "points" he alleges in this thread alone:

1. "A public statement by RT that Bradford etal do not represent their firm would go a long way toward repairing the public relations damage he has done."

CITE your source at RT Systems who believes I have caused P.R. damage.

2. "Your bullshit leaves such a bad impression that it is actually hurting RT Systems."

CITE your course at RT Systems who believes this.

3. "I had a nice chat with RT Systems apparently you are a bit of an embarassments to them but there is little they can do about you."

CITE your source.

4. "The other things I learned gave me a lot more insight into your real motives. It is certainly strange that someone so supportive of RT Systems and the ADMS software would want the command codes for the Yaesu radios. That looks more like someone who intends to produce a knockoff rather than someone who supports RT Systems and the ADMS software."

CITATIONS???

5. "It is apparent that what you really want to do is to produce your own product it was all quite interesting. You sir are a liar and a fraud and are simply trying to divert attention from this."

CITE the alleged "project" you refer to.

6. "...that it was obvious you wanted to develop a competitor to ADMS. Or perhaps you just want the Yaesu command codes to be a big shot. Why don't you just figure them out like Goran did. Perhaps you're just

too lazy and unmotivated as we have previously
discussed."

CITE any evidence you have that I wanted to product any product on this subject.

You cannot use Karen nor Rod at RT as your "source" for your accusations. As a matter of fact, you cannot provide the name of ANY principal at RT Systems who will back you up on any of the above.

If you could - you would have by now...

You cannot provide legitimate copies of anything I have stated or written asking for "codes" for anything. Nor can you demonstrate any interest of mine to get involved in any such project in ANY forum/medium.

If you could, you would have by now...

I do not know why you invent such silliness, Gerry. But it's quite boring, actually.

And, just for your enlightenment, Gerry, I will sign this message:

The primary thing that made the HTX202 such an attractive
HT for amateurs is that it *didn't* have a front end open from
DC to daylight. It had good tight front end filtering instead.
That made it very immune to IMD.

Sadly, the "real" ham radio manufacturers seem to have
forgotten that they're supposed to be making amateur radios.
They seem to think that they're making DC to daylight scanners
instead, with amateur radio thrown in almost as an afterthought.

Well put Gary. Those who have not had the pleasure to use any of the 'older'
ham band only radios don't know how bad most of the new radios really are
when it comes to IMD. I had an HTX-202 and never had any trouble with IMD
in the Dallas downtown area. When I tried to use my IC2GXAT talkie it was
virtually useless!

The same is true at UHF. MY old Yaesu FTC5203 'diode programmable' HT is
set up on GMRS. I have no trouble in downtown at the first saturday sale,
but I hear numerous people with the FRS radios being 'eaten alive' by the
local paging transmitters.

I agree completely. The best HT I ever had was an Icom IC-02AT; I wish I had not sold it. I have an HTX-202 now, and have no desire to "upgrade" to any of the current crop of HTs.

>common, and nowhere near cheaper than a CPU without an RTC.

Right. And I have used them, and the types I used

- had the RTC disabled at manufacture, a special sequence was needed to
start the clock running and set it to local time

- had the RTC as a separate item that was difficult to read and would
certainly not influence the system by itself

I can understand that maybe someone used these devices only for the CMOS
RAM feature and did not need the RTC, but it is difficult to imagine that
the RTC would cause any havoc.

>The embedded Y2K issue keeps coming, and it is perhaps the most

Source record: 105259

I hope somebody will be able to help me. I have a tk-862 commercial radio from Kenwood and i have a problem.
As soon as the engine of my car is running I can't reach the repeater because the noise generated by the alternator is added to my tx singal causing the receiver of the repeater to ignore the noise added to the ctcss. If the engine is not running, everything is ok. I tried to put a noise filter in line the power cable: same thing is happening. I even tried the radio in another car to make sure the alternator of my car is not faulty. Always the same results.
Need help!
Thanks

You'd better start preparing to fork over a lot of dough for at least a 50A power supply, not to mention the finals required for that kinda of output. You can't convert such little drive to a great output like that.

Good Luck :)
73's..

Kenwood R-1000 Receiver

Works well, looks rough.

I took this in trade a few years back, and have been using it until recently. Now I anticipate replacing it with an HF rig with General coverage.

The case has been repainted; Black. Has scratches and signs of pitting from original paint job.

Rear panel has rust and pitting; original paint

ext speaker jack relocated and a "F" connector installed in its place. I suspect that this was a mod to provide power through the coax to an antenna mounted preamp, although not sure, as I have always used the SO-239 connector. The "F" is coupled to the Remote connector (7 pin din) through a 1.0 MH choke, as well as coupled to the SO-239 connector via a .1uF Monolithic capacitor.

The DC power in connector has been removed and I have installed a DB-9 female connector coupled to a data slicer (741 opamp design like the Hamcomm interface), which is fed from external speaker jack wiring. I suspect that the DC Power wiring was redirected to the remote connector also, but I have neither a manual or schematic to verify this.

Display is fine, receives well, all original knobs (with the exception of the BAND selector knob which I replaced)

Controls all ok except the tone control which is the inner shaft of a dual pot (AF Gain inner, TONE outer) which has come loose within the pot assembly.

Front panel has some scratches and scuffing.All numbering and lettering are in good shape.

I have used this receiver for data decoding (rtty, wxfax, ascii, etc.) and monitoring various HF nets, and it has always served me well.

I would like to swap this receiver for a good handheld frequency counter with rechargable batteries and a range of at least 1 MHz to 2 GHz.

Other offers entertained. I am looking for PIC programming gear, BASIC Stamp items, would love to get a digital camera, or even a

cash contribution to the shack fund around the $150.00 mark. I feel the trade aspects may offer a better benefit for both parties, and will make every attempt to be fair in my representation of items offered and in considering possible trades.

Thanks for reading,

David

internet capabilities. Please direct all calls to him at 209-274-2714
bewtween 6:00 PM and 11:00PM Pacific Standard Time.
Kenwood TM-742A tribander with 2 mtrs and 440, no mobile mount,
for $450.
Yaesu FT-221 20 watt 2 mtr multimode, no mike, for $250.
KLM 10-70BL 70 watt 2 mtr amplifier (no preamp) for $70.
Take both the FT-221 and KLM 10-70BL for $300.
Astatic Silver K Eagle mike for $70.
Yaesu FT-8000R 2 mtr and 440 mobile for $400.
Mirage B34G 2 mtr 35 watt HT multimode amp for $45.
Ranger AR-3500 10 mtr 100 watt version for $400.
Ranger AR-3500 10 mtr 35 watt version for $300.
Again please call Craig at 209-274-2714 about these items.

Some thoughts:

Whilst some of the TNCs may contain a hardware clock, it runs entirely in software in some implementations, so your question should be widened to which TNC software is Y2K compliant.

For example, a very quick review of TF2.7B reveals this bit of code:

```
case 2 : if (time.year % 4)
n = 29;
else
n = 30;
break;
```

which seems to calculate the rollover point for the days at the end of February. This assumes that all years that are evenly divisible by 4 are leap years, which is not true, but it will work correctly for Y2K, but will fail in 2100. There may be other TF2.7B issues.

Equally importantly will be the workstation software which may be set to preload the TNC clock every time the software starts.

I would think the most critical elements will be node software for TNCs which may run in unattended remote sites and a failure to rollover and end of this year might stop them and require physical attendence to restore service. Hardware vendors would not be authoritive on node software unless they have specific ports to their equipment, you will need to contact the development groups.

Of course, no responsibility for any errors or ommissions in the above.

Please list the types of micro's that have this feature, and are not
advertising it as a real advantage that warrants extra cost on the item.

Please explain how it locks up the device when the function is unused.

Also explain how the manufacturer solved the timezone problem.

>A few
>months ago I saw a soda machine (also without visible means for setting a date

Of course the function was not unused in this machine.

Most TNC's use Z80 micros. NMOS devices from the early ages of
microprocessors. I remember that I had one as the central processor in my
first microcomputer, and I could dig into it fairly deeply. E.g. find
instructions that were not in its instruction manual, but still did
something interesting.
In all that time I have never encountered a secret manufacturer-set real
time clock in it.

Clinton just when I think you could not be more dishonorable
you suprise me. I NEVER wrote in any forum the quote above
you attribute to me. What I actually did write is archived so
why you would create a forgery like this seems pretty stupid.
Since you obviously are obviously willing to lie about what
I said in a public forum why on Earth should anyone believe
you about anything, particularly something you might find
embarassing. I've been told by a VERY reliable source that
you have made repeated attempts to obtain propriatary data
related to programing Yaesu radios. Prove you did not do it.

Clinton is not interested in the betterment of amateur radio
just putting people down and cheerleading for his vendor of
the week. Bothering commercial interests about some stupid
internet flame war more like the behavior of a spoiled child
than an adult.

If you want to cry wolf, don't be surprised if someone asks to see
evidence of the wolf. Rob is right on; RTC functions have special
requirements (such as back-up power source) that simply have not been
a common part of CPUs. I believe Dallas Semi makes a series of
battery-backed CPUs with RAM and RTC, but they're nowhere near
common, and nowhere near cheaper than a CPU without an RTC.

The embedded Y2K issue keeps coming, and it is perhaps the most
specious of the Y2K issues there.

I don't see the TM-733A on that list, nor do I see my TS850S.

Bob, I'm interested in the amplifier but not familiar with any of the new solid state amps. could you give me a few details. Im interested in using it with a non Icom rig. Does it require an external antenna tuner. I looked at the Icom web site but couldnt find it. If there is a site where I can get details let me know. Dan

6924. Yaesu Help- FT-101 Processor Installation

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-23 00:00:00 UTC
From: Jacquis <jaclyn@tiac.net>
Message-ID: <7krvev$8t0@news-central.tiac.net>
Source record: 105186

Got a processor board for my FT101EE. I can match up the colors from the harness to the board, simple enough ! After doing this there were two pairs of wires on the radio harness (white/yellow & white/gray soldered together the other pair white & red soldered together) Looked like the bypass loop for the rig when it ran without the processor option. Unsoldering these resulted in matching up the white/yellow, white/gray and red wires to those from the board. Now I have a white wire left ! There was no white wire from the board I bought and I was wondering where this wire will call its new home on the board. With just the operators manual I am a little lost since it does not mention the upgrade proc. option installation. It seems the white wire has around +12v on it and the board has a white/orange going to the +12v terminal on the board. The way it is now the unit allows the rig to modulate but without any processing so It must be ok for the most part (since the op-manual describes the circuit as an amplifier in the proc/off position). It does this (but with increased ALC sensitivity) so I am close but no better than without the board. Has anyone installed one of these or can see where the white wire goes to on the pro. bd. in their rig? There is that white wire with a very faint yellow marker connected so don't let this be confused with the plain white. Appreciated any help ! Jacqui N1DVE jaclyn@tiac.net

Don't waste your time with the manual. It has no
mention of the xband repeat mode.

set the freq's u desire, then hold the F key for a second till you
see an X displayed over one of the buttons. Then just press the
button. Now it's in cross band repeat mode.

Do the same to get out.

Good luck... Mike

For Sale, 2 Kenwood TK-350 UHF 160 Channel Hand Held Radios. The radio are top of the line Kenwoods. They have DTMF Tone Pads, Extra Stubby Duck Antenna, CTCSS, and DCS. The radios are in very clean condition with low use (these 2 radios have sit on a shelf most of their life). The radios will be programmed to your frequency. New NiMH batteries are also available for the radios. I have a rapid dual battery charger and a single rapid battery charger for the radios as well as a speaker mic. The radios are 450-470 MHZ, but they also work on the Amateur UHF Band.

For Sale, 1 Kenwood TK-250 VHF 160 Channel Hand Held Radio. Same as the above radios except this radio is for the VHF Band, 150-170 MHZ and does not have a DTMF Tone Pad. Also this radio works in the 2-Meter Amateur Band.

These radios are in like new working condition. The only reason I am selling them is due to the fact the department I am a Police Chaplain for is moving to a Trunked 800 MHZ system. If you are interested in any or all of the above equipment please email me at chaplain@vvm.com and I will price a package for you.

Maybe Yaesu thought (correctly) that most hams would not use their
mobile HF transciever to listen to SW BC (I do with my 706MkII, though).

That given, why would they want to raise the price of every FT-100 they
sell by even half the price of that filter??

6948. FT100 comment and question

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-23 00:00:00 UTC
From: headhamster <headhamster@erols.com>
Message-ID: <3770643F.3F8B6105@erols.com>
Source record: 105281

Several weeks ago I inquired about whether anyone had installed the AM filter in the FT100 in order to improve the SWL performance of the rig. Well I bought the filter and installed it. The AM RX performance is improved dramatically. The rig can finally seperate AM broadcast stations 10 or 15kc apart. While the filter should have been standard, it's worth the money if you like to listen to SW.

I'm interested in finding out if there is any software available to read or write the memories of the FT100. Any help would be appreciated.

>alternators and such.

That's true. NUDETS (Washington-speak for Nuclear Detonations) inside
the atmosphere mainly produce the kinds of ionospheric effects I mentioned.
(From a radio communication point of view, that is.) They alter the
ionosphere in much the same way that a Solar flare does, though more locally.
But it can still play havoc with normal skip propagation for awhile.

OTOH "exoatmospheric" bursts (ones outside the atmosphere) are the ones
that produce primarily the EMP effect (unless, of course, an important
satellite happens to be nearby). What happens here is very interesting.
The so-called "prompt radiation" from the burst arrives at the upper
layers of the atmosphere at essentially the speed of light. As it
encounters substantial density of air, it knocks loose electrons in
what as I recall is called the Compton Effect, the electrons sometimes
being called Compton electrons. Being in a magnetic field, they don't
follow straight lines away from the point of impact but rather fly around
and around in a helical path, as a result of the odd fact that the force
on a moving charge due to a magnetic field is always at right angles
both to the velocity and to the magnetic field lines. This high-speed
motion in a helix of course generates radio waves, which travel at the
speed of light. But what makes the EMP so nasty is that the incoming
Compton electrons are also ARRIVING at the speed of light. So the
point at which the waves start getting generated moves downward at the
same speed as the waves are propagating. The practical effect is that
the energy buildup in the wave continues to be RIGHT AT THE WAVEFRONT!
Which means that the wave takes the form of a very sharp pulse wavefront
that has a bandwidth of perhaps hundreds of megahertz, and LOTS and LOTS
of energy in it.

It is this very sharp pulse wavefront that causes all the trouble.
First of all, it can generate many kiloamperes of RF current in a
conductor, for a brief moment, and kilovolts or even megavolts of
peak voltage, depending on the circuit impedance of course.

Also, the fact that the bandwidth goes out to the VHF/UHF region
means that equipment designed for lower frequencies may not have

adequate "bypassing" to deal with the sharp peak. Even HF (3 -30 MHz) radios need to have bypass capacitors with very short leads, as if they were VHF / UHF radios, in order to tame the kind of pulses in an EMP. Not to mention unusually good shielding, parasitic chokes on leads entering the shielding, and a lot of techniques that just aren't normally used in equipment not specifically designed to be EMP-resistant.

For hams, keeping a spare radio in the trunk of your car, or in an underground shelter, or in a metal storage cabinet, might be one of the better ways to have equipment survive.

According to the FEMA consultant whose lecture on EMP I heard some years ago, the peak of the EMP spectrum is estimated to fall at AM Broadcast type frequencies, despite the very sharp risetime. I think this relates to the dynamics of the electrons' helical motion in the Earth's magnetic field that I mentioned earlier. But anyway, any piece of conductor that resonates in the low MHz region, say 0.5 to 3 or so MHz, will pick up the biggest spikes. Short conductors, like the one on your 2-meter HT, may only see a few hundred volts peak. However, even that much could well wipe out the front end of your radio.

>most devices bite the big one? Probably, but they would also be a lot
>of survivabilty that you wouldn't expect.

Most analyses I saw seemed to conclude that tube equipment was MORE likely to survive, simply because tubes are inherently less prone to failure from high-voltage pulses than solid state devices are.

Failures of solid-state devices would probably be quite widespread, but erratic. Indeed some radios would get lucky and survive, perhaps just because the standing wave pattern didn't hit them with as high a signal level as some other radio received, maybe even in the same room.

My impression is that the phone company would come out fairly well because they have historically put so much emphasis on protection against lightning. However, the lead lengths they use from the line to the varistor devices they use for protection would probably be so inductive at VHF / UHF that sizeable spikes would remain. Old-fashioned phones should be fine, but solid-state phones and modems might well get zapped. There would doubtless probably be quite a few "ESS" failures (telco switch computers).

Today the power grid is probably LESS sensitive to a massive overload. The technology for handling 'events' such as lightning strikes is much improved. In that regard alone it might be a neat idea to just contact a power company and ask them how they have changed since the 60's.

Indeed, that would make a fascinating topic for a radio club meeting.
I bet they'd be surprised, though, that you were asking about EMP
rather than Y2K !!!

Incidentally, you might be surprised to find that FEMA themselves would
be happy to send someone out to talk to a ham radio club on both of these
subjects, particularly one located in a large metropolitan area that
would publicize the talk widely.

>I was told a ground busrt doesn't yield near the EMP of an air burst.
>But that's not to say it still won't knock out tons of equipment. Mike

The "exoatmospheric" burst generates the EMP as its main effect.
The less atmosphere between you and the burst, the less of an EMP effect
it would generate because the pileup of the wavefront described above
would have less time to develop. However, rumor has it that there
are now also weapons designed to produce EMP-like effects at ground
level, without using nukes.

If so, I think that's a step forward, sort of the opposite of the
neutron bomb, which kills all the people without hurting the equipment!
Wouldn't it be nice if the human race could learn how to do warfare in
the future by killing all the computers and weapons systems without
harming the people!

Or even better, if we could somehow learn to do WITHOUT warfare at all!

-John S., W3IKG

To put it into perspective, how close should a lightning hit in order to produce a similar EMP as an ionospheric nuclear blast ?

In the days when the NEMP was a hot topic of discussion, you could easily get the feeling that nothing would survive, but from the equipment that I have seen that have been designed to be NEMP resistant, the protection is not that exotic.

Kenwood has most (all now??) if their manuals on line. Start on their
main page: http://www.kenwoodcorp.com/
Then search for manuals... they are actually on their FTP site but
accissible through the main pages.

ALL companies shopuld do this!!!!

"Marcus Alan Hawkins" <marchawkins@home.com> wrote:
> Help! I'm looking to buy one of these small HT's.

I own each of the three "credit card" radios from Alinco, and enjoy them all.

Some folks don't like the lack of a speaker in the single-band units. I fabricated an Otto Engineering earpiece for mine...as about as comfortable as you can get.

They also only have one scan mode: 5 second resume. And no provision for external/optional antennas.

The little lithium-ion battery lasts longer than "expected."

And there's really nothing smaller and more "stealth" available!

If you realize the power limitation - and don't expect long-distance simplex work - I think you'll like the little credit card radio.

Recent ARRL Handbooks have plans for 1 kw amps for 2 meter band. I doubt
you can drive it with 600 mW however; expect to add another amp stage
to get full output.

On Mon, 21 Jun 1999 08:10:15 +0100, it was observed that Simon Lewis
<slewis@pacsat.demon.co.uk> said:

<snip>

() -You will also have fun if you try and wire a mobile mic up. Its not
that
() -simple as the PTT runs on seeing a particular resistance as there are
() -loads of controls in the mic as well! Pager probs here on a friends one
() -as well. Seems to work OK in all other respects.

I have a GIF of the mic CCT if anyone wants it, I could post it to the ng's
but I bet I'd get well flamed for it :(

In UK you could have a search on Dajanews for FT8100 and you might well
come up with a posting from me with the address of Mobilite, - used to be
Heatherlite, - who produce a hands free mic setup for about 45 quid.

I'm fairly happy with my rig, I did have a problem with it just before the
warranty ran out, - VHF was going dead suddenly ?! - and it ended up with
Yaesu giving me a brand new one when they couldn't fix it :-) Apart from
that, it's a good rig and yes it does have the remote head facility, -
another 55 quid for the cable/interface :(

John, I have owned the 2500 and the FT-3000 and If you are gonna limit yourself to just a 2 meter radio, then hands down the best radio is the FT-3000. If you are in to scanners and monitoring, this radio will do it up to 999 meg and it has a 70 Watt output on 2 meters, It will also crossband repeat from 440 meg to 2meters one way...BUT if it was me I would get a good used FT-8000 Yaesu that has Dual band capability, plus will receive up to 1,300 meg and Crossband Repeat. I have one on the way to me I bought on the internet for $ 300... The FT-8100 is the same as the FT-8000 but the display will come off the radio and remote mount... If you have to get just a 2 meter get the FT-3000 and you wont be sorry.

-----------------------------------------------------------------------

I am sorry, but THIS subject I simply can't ignore.....

There is something about all this EXPENSIVE nonsense
about "STAR WARS" and similar methods of Anti-Ballistic Missile
defenses that grates on me.

WHY are we spending who know how many BILLIONS of
dollars on this ???

There are so many ways the money can be used for helping
people......

---------------------------------------
```

OK, here is my reasoning:

1.0 The MISSILE'S function is to deliver the bomb to it's
destination and detonate it when the aggressor nation
want's to kill somebody.

2.0 The purpose of these defense systems is to stop the
missiles BEFORE they can get to their destinations and
detonate their warheads.

OK, fine.

BUT, if I were in charge of being the aggressor, I'd spend a tiny
fraction of the cost of the Ballistic Missile and smuggle the bombs
to it's destination some years prior to the war.

This way, I wouldn't have to develop expensive and delicate
missile systems, just use the same methods drug smugglers have
used for many years.

All that fancy "STAR WARS" garbage means absolutely nothing,
since the bombs are already at their destinations.

SO, why are we wasting our money trying to develop a useless
system ?

I suspect it's due, in part, to the reluctance of the politicians
in charge of military projects to admit to the public that there
IS no defense against this tactic. Well, that, and a tenancy
to want to keep money flowing into programs that help
keep them employed.

Things would be simpler if all the major nations admit that they
have done this smuggling in of weaponry and that there is no
practical defense against it other than the knowledge that the entire
world would go up in smoke if ANY of them started a major offense.

Yep, "MUTUALLY ASSURED DESTRUCTION"

If they all admit to this obvious tactic, then we can stop wasting
money on useless "defensive" programs and use the money
for something constructive.

Like, for example, helping the large starving parts of the world...

Yeah, true, it WOULD require politicians and military types to admit
to reality.... That seems to be a problem with some people.

7032. ULS: FCC allowed to collect your phone number /e-mail and publish it

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-24 00:00:00 UTC
From: mf_luder@my-deja.com
Message-ID: <7ks944qed1@nnrp1.deja.com>
Source record: 105201
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.swap,rec.radio.amateur.space

The ham part of ULS which requests your e-mail address, the usual info, plus your SSN or TIN and YOUR PHONE NUMBER is due to start in August says lamb to the slaughter ARRL. FCC is out of control.

Let's ignore government abuses, because paranoid is the usual ignorant reponse of most morons.

A hacker can get your bank info if you use direct deposit for any government checks (like that Social Security all you retirees like), will have your e-mail to infect you wth e-mail viruses, etc.

Think it can't happen ?

If the FBI, State and Defense are being defaced once a week for a month, they'll steal your private data just as easily.

Why does FCC need your phone number, when they have your addrss ? That's absurd ! Furthermore, now your phone number and e-mail will be, without your say-so, public, if you want your license.

Try the online form; no phone number, no filing !

How about the thousands of old or disabled or low income people who will need to comply ? They won't have internet connections. What a way to thin out the technologically behind hams ! FCC says sign-up on paper; why ? if you can't derive any benefits to begin with ?

> HERE IT IS !!! CHOOSE YOUR UNLISTED PHONE NUMBER OR YOUR HAM LICENSE.
>
> In addition, all information provided in this form, except Taxpayer
> Identification Number, will be available for public inspection. If you do
> not provide the information we request on the form, the FCC may delay
> processing of your application or may return your application without
> action.

They say they have this right because they need the info to collect revenue. Where are the license fees then ? Most people don't have vanity calls ! There goes that rationale.

Plus, they need your phone number ? Why ? When the Coast Guard gets fake distres calls 9 times an hour because of the unlicensed service ? Why are we to be cataloged more closely than the life-or-death marine radio service ?

Plus, now for the first time in the history of the ARS, if someone doesn't like what you have to say, even an SWL, well, heck, they can just look you up and give you a PHONE CALL...

It sounds like a VHF mobile duplexer. I know of no business repeater
channels in the VHF area. Most are 450-470 and your unit will not tue
there.

Like most current scanners ect, The radio isn't "blocked", it's
"deleted", which means it can't be "unblocked". You must purchase a AT-600D
(Canada/Europe) for full 800. The FCC no longer allows radio mfgrs to build an
item to include cellular then "block it" with a diode or code ect, it must be
deleted completley unrestorable.

From: Clay Juckett <clayj1@my-deja.com>
Message-ID: <7kti1g$8e6$1@nnrp1.deja.com>
Source record: 105219

I'm looking for detailed information regarding programming the Kenwood TM-V7A. Kenwood has a software gizmo that writes/reads the memory channels ... but NOT the menu modes/states or PF options. Has anyone attempted to develop software on their own? Is there any information out there on data formats used between the radio and the PC? My goal is to write a better programming interface for my radio that will allow me to program more of the radio's features in a better interface.

Thank you,

Clay Juckett

There has been an error in the description

1. They are not available with the 1 watt amplifier and speaker.
There is an adequate 600 ohm balanced output that will drive a simple
amp.

2. There are no units available with the AM Collins filter

3. The units come with a voice operated squelch. Very nice feature, the
picture has been
re-scanned.

sorry for any inconvenience this may have caused.

First...Ill tell ya Im no radio expert. Im a Deputy with the local Sheriffs Dept.
I just bought a VX5R, with the feeling that it could be modified to receive and transmit in the ranges I need for
work (say 150-159 mhz). I will only use this radio for the off-duty security work I do.
What I need to know is....can this radio be modified so I can transmit and receive in this range?
Any and all help is greatly appreciated!!
Mark

>of energy in it.

This isn't quite correct. When the nuclear device detonates, it generates large amounts of prompt gamma radiation. Gamma is electromagnetic radiation of an extremely high frequency (higher than X-rays), so it travels at the speed of light the same as any other EM. If the detonation occurs in atmosphere, the gammas are rapidly absorbed over a short distance by the atmosphere, generating an incredible heat pulse. The rapid expansion of this superheated air is the primary blast effect of a nuclear device. Relatively little NEMP is produced.

But when the device is detonated at high altitude, there is little sensible atmosphere to absorb the gammas. Instead they encounter the free electrons in the ionosphere. These are accelerated by the gammas, just as they are accelerated by any radio wave encountering the ionosphere (or as the free electrons in your antenna are accelerated by a passing radio wave). But since the gammas are so energetic, and are available in copious amounts, the acceleration produced is *much* stronger, and the reradiated energy as the free electrons decelerate is also much greater.

The free electrons do *not* travel down to the surface, nor do they travel at the speed of light (though they book right along after the initial

acceleration). As they approach the sensible atmosphere, they encounter sufficient air density to be stopped while still many miles above the surface.

Because of inverse square spreading, the gamma wave front will impinge on a large segment of the ionosphere, so the effect is spread over a large area. The reradiation as the free electrons are decelerated is also over a wide area, but bunched vertically in the upper stratosphere as air density becomes greater. This produces a sharp wavefront extended in area. We can treat this the same way as we would a uniform current in an infinitely long wire, so this reradiated field falls off only with the inverse of distance rather than as the inverse square of distance as would be the case if it were a point source. That's what makes NEMP potentially dangerous to our equipment on the ground.

A 20 MT device exploded at an altitude of 100 miles will produce a field strength on the ground roughly equal to that produced by a lightning bolt 8 miles away. But because the NEMP effect occurs over an extended area, the effect is as if there were a lightning bolt 8 miles away in every direction at the same time. The induction will strongly energize extended conductors along their entire length. That's why NEMP is such a threat to the power grid and the phone system.

For the comparatively short conductors we use for antennas and other wiring in our stations, the effect isn't much different from a lightning near miss except that the wave front is steeper, ie the risetime of the induced pulse is faster. So we have to use suppression devices which clamp the pulse much quicker than what we'd need for induced lightning surge. Fortunately, there are gas tubes available which fire in under 2 nS, and that's adequate.

>Those who plan for war are sure to get it.

The appropriate aphorism goes like this,

"Those who beat their swords into plowshares
will wind up plowing for those who do not."

Those who do not plan for war will certainly be attacked
by those who do. Appeasers like your Chamberlain learned
that to their sorrow.

The only defense against war is to be ready to make it so
costly to your potential opponents that they don't dare attack.
The Swiss have understood this for 700 years. The rational
among us in the rest of the world have come to realize it in
the last 50 years.

Readiness to carry the fight to any potential aggressor has
kept the peace in the latter half of this century while lack of
preparation for war caused two major world wars in the former
half of the century. 50 million dead was a high cost to pay to
learn this lesson. People like you would have us repeat it
again and again.

The price of freedom is eternal vigilance. Those who would
have us disarm are fools, or worse. When the lamb lies down
with the lion, the lion gets up with a full belly.

It's never a bad idea to go with the 5 watt radios. I have an Icom
W32A,and it's fairly small, and does 5 watts. I know there are some
really, really tiny radios that are out now; I wouldn't go with them

because of the limited output. When I was looking for a radio about a year or a year and a half ago, I found that Icom generally had handhelds cheapest. Yaesu was second, but so far, I've been impressed by yaesu's stuff more. The FT-51R is a good choice, but it's kind of expensive (last time I checked). It's probably within your price range, though. It seemed like Kenwood stuff was a little more expensive, but this could have all changed by now. There are a few new radios out now, too.

OK, as far as software, most of the software for the radios requires Windows (dangit! Linux rules!). You don't need the TNC to program the radio via computer, but you do need the cable and the software.
As far as the packet radio thing, you just need: 1. A computer. 2. A power supply for the TNC. 3. A TNC. 4. A radio w/ antenna.

I haven't run into any TNC's that require cards, but I don't doubt that they're out there. The TNC that I'm borrowing from a local radio club (I'm a high school student too...) is stand alone.

I don't know. I know very little about this radio. I would go with the seperate TNC, personally, but go whatever route you want to.

I read somewhere that it's illegal to surf the net through ham radio.
You can check your email, though (I think). The president of our local
college club (the University of Missouri Rolla) once endeavored to
connect his HP48 calculator to his TNC and radio, and have about the
same setup on the other side, so that he could check his email from
anywhere on campus. He never finished the project, though.

> hole in my
> budget?
The Icom 706 (whatever the latest is; the "G" or whatever) and the Yaesu
FT-100 are about $1300 or so, but they do everything. I don't think I'd
get one because I heard the receiver would not be very sensitive. There
are other transceivers out there that do ONLY HF; is that what you
want? There are many options for HF equiptment. If you want something
older and used, like an Icom 735, for example (kind of a "boring" radio,
though) would be a lot cheaper. I see that kind of stuff every once in
a while on ebay.com.
Hope this helps. I'm certainly no expert, but if anyone catches an
mistake, _please_ correct me!

Paul,
Not sure who the Yaesu dealer is in New Orleans, I do know of a ham dealer there in the area. The name of the dealer is called "BAMCOM", I think. You may want to give them a call to see if they handle Yaesu. Or best yet, email Yaesu and ask them who is their dealer in New Orleans area.
Well, I had my VX-5 for a few days before I sent it back to Yaesu to have a few items corrected. The best way to describe the VX5 is that its the radio version of the Swiss Army Knife. Does a lot of things but may not be the best at anyone of them. Actually to me its pretty amazing how well it works. The problems I have with mine is(was), excessive intermod type noise on the VHF range, low in frequency, and poor rec sensitivity in the 200 to 300 Mhz range. I now know that they all have poor sensitivity in this range, this is too bad due to this is part of the UHF aircraft frequencies.
Also you may want to check out the YAESUVX5 Onelist.com user group for more info.
73 and all the best.

Apparently, ARRL once again wants us to receive regurgitated, properly spun information only through their "know-it-all" mouths.

Again, until this morning, the only thing anyone including ARRL said would be private was your Social Security Number. As one of the people who researched his, I stand by it as being accurate. And until FCC validates ARRL claims, I don't stop my publicity campaign.

Quite a paranoid place when anyone (even a member) who researches something themselves and gets a set of answers right from FCC has an "agenda". You bet I have an agenda- to get the farts running that place out of there before the destroy the RS through their lack of advertising, and lame ass attempts to recruit people (young and old).

BTW, someone ought to teach FCC not to say what they don't mean on the web and on the phone if N1RL is correct...

from almighty N1RL:

Registration of WTB licensees in the Universal Licensing System will be required.

Yes, you will have to supply your telephone number to register for ULS. You'll also have to supply your Taxpayer Information Number (typically your
Social Security Number).

FYI: The current paper FCC Form 610 series already requests a daytime telephone number, so this requirement is nothing new.

No, the FCC has no plans to publish or give out any of this information, and
security measures are in place, we are told. The actual database does not reside on the Internet but on an FCC Wide Area Network.

Please, let's not overreact on the basis of incorrect information and half
truths being spread by those with some kind of agenda. The FCC also has yet
to release full details of ULS implementation, but we are told that it will
be effective for amateurs "sometime" in August.

Visit http://www.fcc.gov/wtb/uls/ for the FCC's most up-to-date ULS information and to register.

According to sources at ARRL, they were actually unaware of the phone number issue vis-a-vis public access.

Again, the issue I think people were raising was not a fear of government peddling our SSNs, but rather application of the FOIPA act gone mad.

I still doubt the security of servers however, uless such info were to be retained on a LAN, based on the recent hacker sprees.

Thus, calls have been placed to determine how those who wish to remain inaccessible to telemarketers and burglars with scanners (yes they get arrested all the time, I have dealt with this plenty) can comply (without giving a pay phone number).

Make sure your COM port set-up is correct. This caused me some problems. I finally called tech support at RT Systems and they helped me get it squared away. You may have to change the Port/IRQ/Input-Output Range settings to find one that matches the ADMS port settings. Go to Control Panel then System then Device Manager and double click "Ports". Highlight the Com port you have the cable connected to and click Properties and then Resources. Windows will assign some pretty strange combinations sometimes, but you can change these settings manually. (i.e. Com 4/IRQ3/Input-Output Range 02E8 - 02EF) Be careful not to change the port settings for your modem or other attached peripheral. You'll end up having to reinstall things if you do. This may get you to the point where the radio and the computer can start talking. If you are successful, create a template file first thing from the radio and then you should be all set.

Oh yeah, don't forget the four conductor cable that connects to the three conductor cable for your radio. Won't work ever if you don't have this in place.

Hope this helps

7083. Icom Q7 shortwave/HF problems

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-25 00:00:00 UTC
From: Curt Phillips W4CP <cphillips@engineer.com>
Message-ID: <7l0sc5$g4k$1@nnrp1.deja.com>
Source record: 105102
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur.equipment

OK, I've "opened up" my Icom Q7A to the shortwave frequencies using Goran Vlaski's excellent software (http://www2.crosswinds.net/frankfurt/~vlaski) to program in some shortwave frequencies into Q7 memory locations. However, the results haven't been as good as I would have hoped. First, I was under the impression that the receiver was essentially the same as that in the R-2 (even an ICOM rep at HAMCOM said so), but it seems pretty deaf. The stations that normally boom in here in Houston (HCJB, RadioHavana, WWCR) can barely be heard. I'm running a 19" aftermarket SMA antenna for it (what, a shortwave antenna needs to be longer? :-) I don't mind rigging a longer antenna, but I was wondering if this was the same with the R-2?

Also, even though I can program shortwave frequencies into the memories using the computer, when I try to do the memory-to-VFO swap, the Q7 "bombs" back into one of its regular frequency ranges (usually aircraft, probably because that's AM also). Therefore, I can't readily "tune around" the shortwave bands, trying to find stations that are strong enough to blast through my monster antenna. :-)

Here I am, paid over $150 for this radio, and it won't really do DC-to-daylight. What a disappointment! :-)

Anyway, I do really like the radio, but I'd like it better if I could solve these little problems.

Any input would be appreciated. After all, all I'm looking for as an AR8000 with 2 meter/440 MHz transmit capability in a case the size of a pack of cigarettes for less that $180. (Trunk tracking would be nice, but we won't go there right now. :-)

Get A Commodore computer and a mfj1271C TNC. Neither has a cmos
clock or dater so they are compliant till 25th century A.D. and
beyond. You enter the date and time each time you use the computer
or the TNC so there is no y2k limitation (grin).

Here ya go!

Notch on bottom, from 7 o'clock counterclockwise it's

7- mic ground
6- audio out
5- 8 volts (power indicator)
4- channel up (connect to ground for function)
3- channel down (connect to ground for function)
2- PTT (connect to ground for function)
1-Mic input

The center pin is ground

73!

I am interested in listening to shortwave broadcasts. I had heard that Radio Shack had a good table top model (the name escapes me right now) and I had seen it out there but it seems to have been discontinued. I don't want some cheap thing like Radio Shack seems to offer now so what is a good comparable model to that one that will not send me to the poor house.

Thanks for your time.

I bought a nice looking, blank steel wall plate at the hardware store,
measured it off, and used a good punch to get the holes. Mounted SO-239
barrel connectors on it, and put PL-259 connectors on the coax feeding
it. Looks nice.

In my case, I added a plastic outlet box, so I'm not really concerned
about the grounding issues mentioned above.

It helps to have access to a machine shop with a decent punch.

Hi all....

This is a NO BS NO SCAM DEAL....AND IT IS FOR HAMS ONLY!

My company is 20 years old and we sell computer parts and Microsoft products at wholesale to re-sellers. There is an even chance you have a product from Amax if you patronize your local computer shop.

I am a salesman for Amax and I am offering to sell either built systems or components to hams at the price we sell them in quantity 50 lots to resellers. This is for real, and so am I.
I am offering this not to make money but as a way to repay the ham community for the TONS of help I have gotten since I got in this hobby.

Go to www.amax.com and check out the stuff there....

Then call me in the Chicago office at 888-810-2629. I am at extension 106.

Our Illinois location has some pricing at http://people.ce.mediaone.net/amaxil but it is kinda old pricing. You can call me for deals, but an email to Doug_Adair@amax.com is best.

73 and CU ON 6 METERS!!!!!!!!!!!!!!!!!!!!!!!!!!!!

Gary

7113. Re: ICOM 746, Does it still poor NB and Selectivity?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-25 00:00:00 UTC
From: Wink <wink@rpa.net>
Message-ID: <37736ED9.F926CF82@rpa.net>
Source record: 105179
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.dx

I have had an Icom 746 for about six months, therefore I feel I have pretty good insight as to these problems. Selectivity; As the radio comes out of the box in absolute stock condition, the selectivity has something to be desired. Icom is competing in a very tough mid-priced HF radio market with the 746. They have to cut corners where they can. Those corners are filters. After installing just the 270 Hz CW filter in one stage of the receiver a dramatic increase in selectivity was noted and there is still another filter that can be installed for CW that will make it even tighter. As for the noise blanker, it seems adequate to me. I have little need for a blanker but when I have it's had an effect on the noise.

I had a Kenwood TS-570D radio before the 746, my personal opinion is that the 746 blows the 570 away in many ways.

Gary / N2UM

EMP will generate a very broad area of coverage. A high altitude explosion will produce 50,000 volts per meter over a 1000 mile radius.

The energy spectral range is different between lightning and EMP. Lightning does not have the fast rise time of EMP and therefore lightning EM energy peaks in the range of LF to MF . EMP, as mentioned earlier, has measurable components out to 800 MHz, but peaks in the MF to HF range depending on weapon design and altitude of burst.

Ground burst EMP exhibits a different characteristic. The nuclear x-rays are absorbed within about 10 feet of the blast center and they produce tremendous heat and EMP. The electrons, due to the earths magnetic field, rotate and curl into the earth as opposed to transiting in a longer space path. They produce a radial field. The nuclear prompt gamma rays, much higher energy photons, require about 1 mile of atmosphere, at sea level, to complete their absorption in the atmosphere. It takes a longer time for photons to travel a mile, so you get a broad pulse width.

All together, nuclear EMP produces about 50,000 volts every ~40 inches with energy peak spectral density in the 1-10 mhZ range. Lightning produces about 20,000 volts every ~40 inches with a peak spectral density in the 0.1 to 3 mhZ range.

Both are very nasty. We have all read about lightning damage to antennas and equipment in these groups. It will happen if ever there is a Nuclear induced EMP event.

==========
Could this be clarified please ?

Is the field strength 50 KV per meter at a distance of
1000 miles from the explosion?

If not, where *does* the 50 KV per meter occur ?

Reg.

Looks like a decent explanation. However I have one question. Shouldn't the signal generated fall off at something between 1/d (close to source) or 1/d^2 (further away)?

Mr. Cho,
There is a vertically mounted circuit board next(left side) to the VFO box, you will see a semi-fixed potentiometer with the small label " B.M ". If you have a separate receiver, listen to the frequency you are transmitting with Microphone gain at the minimum, adjust it for null point. If you do not have a separate receiver, use the most sensitive SWR meter and adjust it to the minimum reading under the same condition.
Good luck to you.

From: kendurham@home.com
Message-ID: <377551a6.186665340@news>
Source record: 105005

I've downloaded and tried 4 different programs for CAT control of my FT736R. None of them work with Windows 98 . All for differenrt reasons. Is anyone running a program for this purpose that works with Windows 98? If so, what has to be done to make it work?

Some say "Can't load DLL", another says "Device Not Available", others say different things (don't remember what.) I'm using the Yaesu FIF-232C interface with AMD K6 II 3D NOW computer.

UPDATE: I got two of the programs to work using an old Cyrex 133 machine running Windows 3.11. They *both* crash the system when trying to change satellites etc. The problem with the Windows 98 machine was my fault. I should have rebooted after attaching the interface. It looks like all of these Windows programs are losers though. I've got a copy of FodTrak for DOS that works fine, but isn't as convenient as a Windows program. Will need to get the FodTrak rotor interface to have a complete system.

The best way to become a ham is...

Go to www.arrl.org. Buy books for the Code Free Technician License and the General Class License. Also download Morse Academy there to teach yourself Morse code (if you get just the codeless tech license, you wont know the joys of ham radio) at 13 WPM. Look for testing in your local area.

Study 2-3 months the information in the books before you go and take your test. Everything you'll need to know is in the questions to study for the test. After you pass your test, go out and buy these 2 radios:

-Either a 2-meter alone or 2-meter/70 cm(440) handheld with at least FM. Be sure to get one with a CTCSS/PL encoder and decoder, rechargeable batteries, and a power supply for the house. It all costs from $150-$300 depending on where you get it. Used equipment is recommended as long as it's solid state. These will be mostly local in range, but on special occasions (youll learn about this) you can work far away with just a 5-watt walkie-talkie.

-An HF Radio (this is where the excitement happens). 100 or 1000 watts, this is your "gateway to the world". Make sure it has at least SSB and CW (CW, or Morse code, is fun believe it or not). With all the antennas, cables, tuners, power supplies and TV and phone interference fixes, it will cost you over $1000 dollars (I got $550 for my station but it was used equipment), unless you use used equipment. Make sure the used equipment is solid state and doesnt use vacuum tubes because of what I hear you have to be an electronics genius to operate and repair them because they go off-frequency.

Add on to that as you get more into it. Maybe get a better license class, or increase your power.

That's all. Cya on the ham bands (My callsign is K3DRQ and I'm 15 yrs old.)

-Cya

Be careful there. The vast computing resources {sic} of the Federal government surely allow them to check the stated number. Thinking again, naw! It's doubtful FCC or any agency has the staff or wherewithall generally to manually call each number and ask "Is John Doe, WB2XYZ there?" To be safe from penalties (haven't read the fine print on Form 610, though most guvmint forms have some nasty threat about false info on them) you can simply transpose a couple numbers from your real phone number. If it ever came up, which it certainly won't unless you *massively* abuse your license privileges, you can simply claim it was a common mistake.

I just got a Kenwood TS-700SP in a trade, and want to know about adding PL encode functionality. I don't use repeaters much, but would like to have access. Did Kenwood make a PL board for this model? As for the aftermarket units, how are these installed? In-line with mic? I'd like to find a Kenwood unit, or an aftermarket model or homebrew scheme for less than the $50 for the Communications Specialists unit.

I have an OMNI VI .. modified to the plus that I will sell. For $1800 I'll throw in a filter or two of your choice. I have the RTTY and CW filters for the first IF and a compliment of filters for the second IF. If you want to deal, I also have a power supply.

Why am I selling it? Well, I have two of 'em. I have not been as active in contesting and Field Day as I anticipated. So, this OMNI has only been out of the box twice since it was upgraded - the full upgrade by the factory - once for Field Day with my grandson .. about 100 QSO and the other time I loaned it to a friend while he sent his OMNI back to the factory.

73! and good luck .. de joe ... NE3H

7168. Kenwood TH-G71A shut-down

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-27 00:00:00 UTC
From: mjlinden@mcs.net
Message-ID: <7l422r$q8i$1@Nntp1.mcs.net>
Source record: 105019

I finally used up the first battery charge of my new Kenwood TH-G71A. When the unit detected that the battery was dying it began beeping and flashing the display. However, I was unable to shut the unit down in this state. It appeared that the unit wouldn't or couldn't respond to me holding down the power key!

Is this normal behavior for this unit? I had to put it on the wall charger for a few seconds before I was able to get enough power to actually shut it off.

I recently got a used TS950SDX. I tried turning on the DSP, but in my
opinion, the audio sounds better without it. What's your opinion ???

Howdy Stephan -- great your desire to get into Ham Radio -- you'll love
it. For info on obtaining a license see URL:
http://www.ac6v.com/pagehh.html

It has Ham Help from the ARRL, exam questions and lots more for
beginners.

Good Luck and hope to hear you on the air soon.

7185. FS: Yaesu FT 900 A/T + Station Mic

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-27 00:00:00 UTC
From: wyatt@kfalls.net
Message-ID: <7l5f6n$p2k$1@nnrp1.deja.com>
Source record: 105036

I have for sale a Yaesu FT 900 A/T plus the Yaesu station MD100a8x microphone. It also includes the hand microphone MH-31a8j. There is NO separation kit as this unit has never been mobile. It is very clean, I would rate it as a 9.5+. These pieces of equipment will go as a set, I will not seperate them. The price of the set is $850 plus shipping. For further info, email wyatt@kfalls.net

Thanks.....W5YHY

Yaesu FT 101ZD..external VFO, and external speaker
has AM on it and yes it will do 11meters. I am not a Ham so I do
not know much more about this radio, other than it does work, and is
in great shape.

I am about to relist this radio and xtras on eBay...The buyer has had
11 days to pay, and he wont even reply to my emails, or return my
phone calls. This radio had a high bid of $465.00 on eBay..+shipping
with a $400.00 reserve...If you want it before I relist it let me
know....BTW
the shipping on Fedx to Florida was $47.50..the total weight was 62
lbs....and I paid the insurance.

>Dj.
Hi Dj,

The easiest way is to buy a Kenwood MJ-48 adapter. There is
one for sale on ebay right now (It's not mine). I'll E-mail the
auction address to you right from the auction site. I've been using my
old MC-50 with my 950SDX, and I'm not satisfied with the output from
the mic. I have to turn up the mic gain to about the 3 o'clock
position to get any kind of alc reading. The MC-43 hand mic that came
with the rig only needs the mic gain to be set at about 10 o'clock for
the same alc reading. Strange, because the MC-50 used to be OK with my
830S.

First I think that is probably a BS-8 panadapter. As far as I know Kenwood only made BS-5 and BS-8 Panadapters (the 5 is for 5.??? MHz IFs and the 8 for 8.883 MHz IFs). I could be wrong but I never heard of a BS-7 probably a typo.

Its been 10 years since I owned a TS-930 and I don't remember for sure if the TS930 has an external "IF OUT" jack. This is what you need to in order to take full use of the Panadpter features of the SM-220/BS8 I suppose it would be possible to modify the 930 if it doesn't have an IF out but I would be tricky. The 930 was not the easiest radio in the world to work on.

I have a few Radio's to sell or trade.
1- GE M-PA UHF 403-430 w/ ant. no battery $125.00
1- GE PCS VHF 136-154 w/ ant, Battery & charger $125.00
2- GE MPS VHF 136-154 w/ ant, 1 Battery & charger. These are also have "
Voice Guard " encryption modules installed $150.00 pair.
I would like to trade for a UHF programmable mobile that will go into the
ham band and be at least 40 watt. Radio can be trunk mounted or dash mount
but prefer dash mount and a minimum of 16 channels.

7206. HP 8920 or Marconi 2945 or 2965

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-27 00:00:00 UTC
From: Jens <jensanke@my-deja.com>
Message-ID: <7l68h8au1@nnrp1.deja.com>
Source record: 105057

Hi,

Can anybody recommend one over the other ?

I have used the HP 8920A quite a bit, like its features but not the menu / User interface to much. Often You need to jog dial 3/4 menus to change a setting.

I believe the Marconi sets have LCD screens. Is this a Pro or Con ?

I need it for service repair for Public, Commercial and Amateur Two way radio: FM, SSB, AM, DTMF, Tone Squelch, Packet, trunked radio.

and for PA and LNA R&D.

Any help appreciated, any suggestions most welcome, and if you know were to find one I'd be very interested.

Thank you

Jens

This is a two meter hand held with CTCSS encode and decode, and approximately 5 watts out with the standard battery pack. Instead of a sealed pack, the back of the radio is removable and any type of AA batteries can be used. Included are all the accesories, plus a set of Ni-Mh batteries in addition to the original Ni-Cads. Batteries can be charged with the included charger or in an external charger. The radio is less than a year old and in very good condition. I already have two other 2 meter HT's, and will sell for $100 plus shipping.

7212. Re: Do you use your 950SDX DSP ????

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-27 00:00:00 UTC
From: Keith Hester <ks9c@chorus.net>
Message-ID: <3776B0A8.E69B0348@chorus.net>
Source record: 105063

Hi Ron,

I'm curious as to what it is that you may have "turned on". The DSP in the TS-950SDX is primarily for generating and demodulating SSB signals; it does not utilize DSP for audio processing of the received signal! It is unfortunate that "DSP" has multiple references and Kenwood has done little to relieve the natural confusion. The SDX does not provide the option of operating without DSP!

The DSP in the SDX is an extremely elegant circuit that generates/demodulates SSB signals; the unwanted sideband is "phased" away with far better passband characteristics than is normally available from ordinary filters.

73,
Keith

I have an Advanced Receiver Research SP144VDG 2 meter receive preamp.
This is the very best of the GaAsFETs available.
144-148MHz
N.F. <.55dB
Gain 24dB
1dB Comp. +12dBm
This has inline RF switching and will handle 25 watts of transmitter
power. Pull out the weak signals with this one. $95 shipped.
Also I have a Par Intermod Filter for 2 meters. This one completely
takes out the interference caused by pagers in the 152-153MHz area which
are the usual cause of 2 meter receive problems. Model is VHFDN152.
It has a very low insertion loss and works with dual band radios also.
These are the most effective filters available. $50 shipped
73 Chris VE3NGW/W4 Florida

I've also had good results using coaxial bulkhead or double female adapters mounted on aluminum plates, lexan or hardwood panels. The threaded double female adapters secure with a nut and washer on each side of the panel, and a drop of Loctite on the threads keeps them very tight.

I don't worry much about additional loss because I try not to use UHF connectors above 50 Mhz anyway. For higher frequencies N or BNC connector feedthroughs can be made exactly the same way. Commercially made light duty metal panels punched for BNC's or N's are available in the "Black Box" computer parts catalog and at Pacific Radio, Los Angeles, CA 323-969-2035, among other places.

At my TV station job, we usually bring UHF 2-way radio transmission lines into our repeater site buildings through a 1/4 or 3/8" thick aluminum plate driled for N-type double females. This plate is grounded with a short copper strap and a piece of heavy wire, which seems to drain off static pretty well.

Does anyone have any knowledge of the WinRadio unit. It is supposed to plug into your computer and provide continuous recieving coverage from 500 Khz to 1.3 Ghz.
Does it perform well?
Does it pick up alot of interference from the computer?
Is it a pretty sensitive receiver? (Specs say .5uv sensitivity)

I just traded for a Kenwood TS-700SP 2M all-mode rig that works and looks terrific. The only problem is in the digital display (LED or flourescent?) which tends to blank and jump as I tune, and the MHZ "ones" segment flickers (looks like it is "hunting") between values.

Kenwood neither has the part, nor has any clue who might. Any idea of the price and availability of a replacement display unit? I would prefer to maintain the originality, but I suppose any display of the same size, voltage, and pin-out would work.

Indeed. That was its real purpose. The West knew it could outspend the East, and that the East would bankrupt itself in an attempt to compete. This showed a nice grasp of human nature which overshadowed any technical merits or demerits of SDI.

There were some nice spinoffs of SDI in the areas of adaptive optics, supercomputing, and high power lasers, but it was never realistically assumed to be a real defense against nuclear weapons. The concepts of castles and moats are dead when faced with the power of the atom.

I just dusted off my HTX-100 to put it in my van and discovered that it is dead on CW. SSB works ok, but when switched to CW the RX sensitivity goes essentially to 0 and RF output is zero with key down.

The schematic in my manual is illegible so its tough to get started on it. Anyone seen this before or have any ideas?

It can be modified. Get a copy of ArtSci Scanner modifications books.
R&L
Electronics should have them.

However, it isn't the best radio for the job. If you can get a
Bendix-King
VHF hi band radio (about $500 used), it is already for that band and
does not
need to be modified. It is also type accepted for commercial use.

You are legally authorized to operate since you are employed by the
people
who have the license for your frequency.

7241. Icom IC-2100H narrow mode?

Does anyone know if the "narrow mode" option for the IC-2100H is something that you can obtain via a mod, or if it is actually specific to the overseas hardware? I don't really have a need for it, but would be interesting to play with if it there, but disabled...

7258. Re: Do you use your 950SDX DSP ????

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-28 00:00:00 UTC
From: Keith Hester <ks9c@chorus.net>
Message-ID: <377765EF.13920496@chorus.net>
Source record: 104945

Hi Ron,

You are indisputably correct! Before responding to your question regarding the DSP in the SDX I really should have refreshed my (not-too-reliable) memory of what Kenwood was claiming in this regard...

Indeed, Kenwood does claim one aspect of DSP acting on the receive characteristics of an SSB signal. And, as you have noted, this is switched on or off via menu #18. Kenwood provides very little hint as to exactly how the action of this feature is supposed to enhance the received SSB signal. When I first looked into this feature I was hoping that the "comb filter" would adjust dynamically to the incoming signal, recognize those frequencies which participated in a harmonic relationship to normal speech and reject all else. (There was a quite sophisticated item manufactured by Phase Linear about 25 years ago that worked along this idea to serve as an LP noise reduction system for hi-fi enthusiasts... it would preserve information that was harmonically related --- assuming it was music --- and reject the remainder --- presumably, noise).

As best as I'm able to determine, the action of menu #18 doesn't begin to approach this goal. It seems to do the following: (1) boost approx. 16 dB at 820 Hz, (2) a very sharp notch of -40dB at 1587.5 Hz, (3) boost of 12 dB at 2830 Hz. I was so unenamored by this "feature" that I essentially removed it from my memory --- thus explaining, but not excusing, my hasty response.

At the time Kenwood introduced the SDX, most amateurs thought of DSP only as a means of processing received audio to enhance intelligibility in the presence of noise. I think the "feature" of the SDX menu #18 was a half-hearted attempt by Kenwood to say "we're also offering receive DSP". As far as I can see it was a very weak attempt... and didn't come even close to what outboard audio DSP units at the time were capable of.

When Kenwood first introduced DSP in the TS-950SD, their DSP was far removed from what amateurs expected. Kenwood used DSP in the production of a high quality SSB signal by techniques reminiscent of the early phasing rigs. In this attempt, they were truly pioneers --- and although the SD or SDX were not "perfect" rigs, their transmit audio quality was definitely a significant improvement over the ordinary filter rigs.

As for your observation: I agree, the DSP function (receive processing) you referred to originally is virtually useless.

Bye-bye,
Keith

Due to the nature of your work, you probably do not want a collapsible metal antenna. Length is great, but you are in a "harsh" environment...

The "piano wire" slim 18" models will perform well for you - but you have to ask yourself whether you want eighteen inches of eye-poking plastic-coated wire comin' off your HT.

You need "rugged" and "durable" as characteristics for your antenna. For YOUR requirements, I'd stick with the original. But if you were set up as a command post with an HT, I'd go for, say, the long, thin, flexible antenna from ADI/Pryme/Premier.

Can you tell me a little more about the heath kit? is it a reciever? and what bands ?? thanks ? I have a golden eagle advertised ,its a 9 out of 10 , tubes are vcery good , andan extra set,its been converted to using the less expensive tubes, the 26LX6 tubes with two driving nine, works perfect and need s from 2 1/2 watts to drive but wouldn't go over 10 watts, checked out ON a R.M.S dosy meter swings over 1kw easly will do more!. low cathode current drainage, it s mean and loud ! wll swing from 50 or 100 to over 1KW could buy your s or work out a trade ?? H3963@aol.com reason for selling is bought a turbo and spent too much money ! got a d&a phamtom 500 , and that s enough un less I can find heath kit 2kw somewhere !

7268. FS:Kenwood TH-G71A

I have forsale a Kenwood TH-G71A dualband handheld. It is
less then 5 months old. I am selling it cause i no longer play
with it. It has been basicly a scanner and mostly used at home
when i have used it. It comes with a MAHA speaker mic,
Kenwood PG-3J filtered cigarette lighter cord,Kenwood BT-11
AA battery case with batteries, bnc to sma connector and two
rubber duckies. One is a Pryme RD-9 and the other is a
Premier RD-8H. Selling this entire package for $250.00
plus $5.00 for shipping.

Stephan, "The ConQueror" replied to you with mostly excellent advice.
I've added a comment or two to clarify a few things....

The ConQueror wrote:
>
> The best way to become a ham is...
>
> Go to www.arrl.org. Buy books for the Code Free Technician License and
> the General Class License.

Even better, try to find a local ham radio club. The ARRL's web site
(http://www.arrl.org) has listings of radio clubs around the country.
Find one near you, and find out if they run license classes. Many do,
and it's much easier than studying on your own. They can tell you where
and when to tyake the exams, as well.

> Also download Morse Academy there to teach
> yourself Morse code (if you get just the codeless tech license, you
> wont know the joys of ham radio) at 13 WPM. Look for testing in your
> local area.

Code is a blast, but don't worry if you don't get it right away. Get
a "code-free" license (a Technician license) so you can get started on
the higher frequencies (above 50 MHz). There's lots of fun stuff to do
on those frequencies, even if they don't allow you to talk as far
without huge investments in equipment.

If you do get a Tech license, keep working on Morse Code and study for
a General license, so you can join us on the world-spanning HF bands.

An old Radio Shack HTX-202 can be purchased for just over $100 used.
They don't make them anymore, but there are plenty of them out there
on the used market. I've not heard much about Radio Shack's newer
hand-held radio, so I'd avoid that until reviews start coming in. Their
stuff is usually badly overpriced, weak on features and behind the times

on technology.

> -An HF Radio (this is where the excitement happens). 100 or 1000 watts,

> but it was used equipment), unless you use used equipment. Make sure
> the used equipment is solid state and doesnt use vacuum tubes because
> of what I hear you have to be an electronics genius to operate and
> repair them because they go off-frequency.

The comment about tube equipment isn't entirely accurate, in my opinion. I bought an old Kenwood TS520 for $250 at a ham swap. It has solid-state circuitry, but tube finals (the part of the circuit that does the final step in amplifying your transmitter signal to 100 watts). It's a fine rig, sensitive receiver, and no problem to operate. Unlike more modern rigs, one has to take a bit of time to tune it every time you turn it on and every time you switch bands. No big deal, and does NOT require an 'electronics genius', nor does it go 'off-frequency'.

Good luck, Stephen, and feel free to email me if you have any questions.

Bob, KI8AB

Hello-
I'm 14 and really into radios and electronics. I just built a charger for my HT600 radio and it works fine, but I'd like to add a circuit that shows when a battery is connected and charging rather than just power being applied. How would I go about doing this? Also, what is an easy way to determine the capacity of a battery pack? Can I just hook up a ammeter to the pack and get a readout? I really like those commercial analyzers but they are pretty pricey! I would try with my VOM but it only reads to 200 ma and the pack is rated around 1200. Anybody know a quick way to do this or have an analyzer for sale cheap? Thanks a lot for any help and please reply directly to me. 73!

Indeed. That was its real purpose. The West knew it could outspend the East,
and that the East would bankrupt itself in an attempt to compete. This showed
a nice grasp of human nature which overshadowed any technical merits or
demerits of SDI.

There were some nice spinoffs of SDI in the areas of adaptive optics,
supercomputing, and high power lasers, but it was never realistically
assumed to be a real defense against nuclear weapons. The concepts
of castles and moats are dead when faced with the power of the atom.

Indeed, it may have worked for you, a conspiring member of a very small world population minority, including North American citizens like yourself. But it does not work for by far the great majority of the world's population. It is they who have been robbed.

But, of course, the remainder of the world's very sensible, intelligent, better educated population do not expect you to admit it. It goes against normal human (aggressive) nature. So don't worry about it.

Get a Diamond SRH series for the FT-50. Right away I noticed an improvement over the stock antenna. They make a standard and a longer length type with a small base and thin, very flexible wire. I didn't believe it would work better until I installed it.

7293. Re: 2nd car batter

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-28 00:00:00 UTC
From: mikewktla@aol.com
Message-ID: <19990628170255.08077.00003951@ng-fs1.aol.com>
Source record: 104980

The contactor type isolator works great,
it was an option on my early 80's Ford
Van.

I've also used the dual diode type
isolator, which is 2 massive, heatsinked, high current diodes...probably 100
Amp
or greater rating...
with the anodes connected together
going to the alternator output, and the
cathodes going to the + terminal of
the main and spare car battery. The alternator sense terminal is right at the
battery, so the voltage regulator increases the alternator voltage 0.6 volts to
offset the
diode voltage drop. No electronics or
equipment in the car are affected by the increased alternator voltage, as all
are fed from the battery terminal.
The units come with a circuit breaker
(mine was 30 amp) that you install in the
charging lead to the spare battery. That way, nonessential equipment wont hog
all your alternator power.

Using this system, I could use the
spare battery for camp lighting, ham
equipment, etc and drain it pretty far
down without worrying that the main car battery would be affected. When the
engine is started, the spare battery charges with the main. Once, I left the
headlights on and drained the main
battery...but jump started the vehicle with
a jumper cable between the spare and main batteries. Not quite as good as the
contactor system which would have automatically connected the main and
spare batteries together, but it did the job.

Commercially made diode isolators
are available at auto stores (I got mine
at Pep Boys), also at Marine/RV
shops. You can also get them with
three diodes for two spare batteries.
Hookup is easy and the units
come with instructions.

==========
Hi Keith,

If you look in your 950SDX instruction manual on page 48,
section 4-11, you will see that menu item #18 turns the DSP function
on & off. The default setting is off according to the chart on page
26. Menu items 18 thru 22 control the DSP functions---at least, that's
the way I read it.

> applied. How would I go about doing this?

Since I don't know what type of charger you built, this is difficult
to answer. The charger must be able to charge the battery at the proper
current and there are several ways to do that.
There must be some way that the charger limits its current into the
battery - so the battery is not charged with too much current, causing
overheating and harming the battery - and with not too little current so
that it takes forever to get it charged. Batteries are typically charged
at the C/10 rate (that's 120 ma for the example battery of 1200 mah) for
12 to 15 hours. IF you charge them faster (more current), special
precautions are required to keep from over charging and harming the
battery. You can use a timer or a fancy circuit to sense when the battery
is nearing full charge.

For sensing when the battery is charging, a common and easy way is as
follows. Put either an LED or a bulb in series with the battery and
charger. When the battery is connected, the current which is charging the
battery will also light the LED or bulb. HOWEVER, the charger must be
able to still charge the battery with the LED/bulb installed. Also the
LED or bulb must be able to handle the current which is charging the
battery. Some figuring will be in order to get it right. Again, without
knowing just what the charger is, and how much current is it charges at
and what its voltage output is, it is difficult to suggest values.

> Also, what is an easy way to
> determine the capacity of a battery pack? Can I just hook up a ammeter to
> the pack and get a readout?

NOPE! Definately NOPE! Connecting the am-meter directly to the
battery will draw ** really ** high current. Ohms law says I = V/R the
"R" of the ammeter is really low. Therefore the "I" (current) which
results, will be high. If I were to guess, the 200ma range on the VOM has
less that .5 ohms resistance. Therefore I = 9.6/0.5 or something like 19
AMPS !!! POOF ! goes the ammeter ! Nicad batteries can supply quite a
lot of current.

> ... I would try with my VOM but it only reads to 200 ma
> and the pack is rated around 1200.

First there is a BIG difference between the VOM rating which is a current rating (200 ma) of how much current it can measure and the battery rating which is different - it is in mah or milliamp - hours. A battery with a rating of 1200 mah can supply a current for a time which is a total of 1200 when you multiply the milliamps TIMES the hours. Although this is just a bit over simplified, it goes like this. For short periods (and with low resistance loads) THis battery can supply in excess of 10 amps. This is what is done for those really neat Radio Controlled cars. The motors use 1200 and 1700 mah batteries and draw 10 to 15 amps and run the battery down in about 5 minutes.
Let's see, 5 minutes = 0.833 hours so... 10A x 0.0833h is 0.833 amp-hours. This is about all you'll get from the 1.2 AH battery at that high a current drain - more below...

If a battery has a capacity reting of 1200 mah, it can supply:
1200 ma for one hour or
120 ma for 10 hours or
12 ma for 100 hours.

Note that 1200 ma = 1.2 A
120 ma = 0.12 A

By the way, the ten hour rate is the common way of figuring it.

In reality it won't quite do the one hour thing and it'll probably do the 12 ma for longer than 100 hours, but it is a good first approximation. Therefore the only way to find out a battery's capacity is to put a known current load and time how long it runs and still gives 1.1 volts per cell in the battery.
You can do this with a resistor. You need ohm's law to figure the resistance given the battery viltage and the desired current. Then you need to make sure that the resistor can handle the power being put into it. That's power = voltage times current.

EXAMPLE:

Find the capacity of a 9.6 volt , 1200 mah battery.
C is 1200 for this battery.
V is 9.6
Resistor for 10 hours discharge is one which draws 120 ma or C/10

R = V / I or
R = 9.6 / 0.120 gives a resistor of 80 ohms

An 80 ohm resistor will draw 120 ma.

The power dissipated in the resistor will be:

P = V * I or
P = 9.6 * 0.12 = 1.152 watts

To be safe you need a resistor of twice that or at least two watts dissipation. This could be made up of several resistors which have a total resistance of 80. For example, a series string of 8 ten ohm resistors each with a power rating of quarter watt gives 80 ohms (8 x

10) and is capable of dissipating two watts (0.25 x 8). They'll get a bit warm, but just keep them in open air.

So now you just have your load.

To test the battery, you connect the fully charged battery to the resistor load and see how long it takes for the battery to discharge to about 1.1 volts per cell or, in this case 8.8 volts (a 9.6 volt battery has 8 cells -- use battery volts divided by 1.25 to get number of cells for any ni-cad or nimh battery). It should take about 10 hours. You'll have to start early in the morning, I guess. You could do the test at 240 ma and go for 5 hours to make it easier.

In the end. the capacity of the battery will be close to the time the test ran (in hours) multiplied by the current which was being drawn (in amps). A little error will creep in because the battery voltage slowly goes down and the current is not absolutely constant, but it'll be minor.

Hope this helps explain it

Regards, Steve

I recently received a radio that was packed and shipped by UPS but arrived with the top lid bent so it sticks up about an inch. . It was packed very well in molded foam and no damage was apparent on the box. What I think happened is it was packed upside-down for some reason, the lid flopped open and caught on the solid foam packing when it was inserted into the box. The box was insured , can somebody tell me what the procedure is to contact UPS? or is there a FAQ on this ? Any help sincerely appreciated. Tnx es 73's Clyde- WA6DCM

7317. Rigs for 1296 MHz?

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-29 00:00:00 UTC
From: Peter Coffee and Carolyn Major <pcc_csm@earthlink.net>
Message-ID: <37799BCF.C45D08DD@earthlink.net>
Source record: 104748

For many years, I've been thinking of trying out the 1296 MHz band, mainly as a place (so to speak) where one can build exotic antennas that don't require a rented crane to raise. I'm finding, though, that many of the rigs that used to be on my wish list are no longer available through usual channels, and may not even be in production any longer.

Can anyone point me to a reputable maker of equipment for this band? Or does everyone just use transverters, or what are people doing up there?

Thanks for any help,

- Peter, AC6EN

Pat,
Purchased my VX-5R from RT Systems in Huntsville, AL. They have the VX5 for $345.00. Not sure if there is anyone selling them for less. They were selling them at the Dallas Texas Ham-Com for $329.00, understand they had the same deal at Dayton. Purchased mine at the Dallas Ham-Com, used it for a few days and discovered it had a few problems. The receiver was eaten up with intermod pager noise in the VHF range and it was off frequency. Its now at Yaesu being repaired. Lots of people have VX5's without any problems but some do. Suspect their quality control is not the best. These radio's are in great demand now and I'm sure Yaesu is cranking them out pretty fast without extensive testing before they are shipped. Anyway, Ill be real happy when I get mine back from Yaesu service. Its kinda like the Swiss Army Knife of handheld radio's. If you get one let me know what you think.
73 de Randy Perkins, WB5KCM.

If your radio does not draw too much current on xmit, you might also consider using a piece of RG-8 for the power lead. This will also give you some shielding.

Farrel-

The carrier crystal for SSB is at the edge of the IF filter passband, but the crystal for CW is within the passband. It sounds like your CW carrier crystal may have shifted frequency or stopped oscillating, since changing crystals is one of the few differences between the CW and SSB configurations.

Hi Dave,
Do not worry, there is some defanse.
You must made rotating high-frequfency shield.
You can made it with tree of Tesla's coils.
Every secundary put on next primary, and made one circle.
Everything must be in resonantion state (all of coils).
All the best,
Proka

7351. VX-5R and Intermod

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-29 00:00:00 UTC
From: David Ballenger <ballenger@erols.com>
Message-ID: <37790521.80931914@erols.com>
Source record: 104931
Cross-posted to: rec.radio.amateur.equipment,alt.ham.radio.vhf-uhf

June 29
Dear group:

I have a VX-5R and live right below Washington, DC. With the factory antenna, I only get pager-type intermod sporadically. However, using either a telescoping whip, a mag-mount or any other external antenna, I get intermod leaking all through 2M.

I brought this up with HRO and they said that this really was endemic with all HT's - they are not designed for use with external antennae. The salesman said he could not recommend another HT that would be dramatically better.

I will only have one radio for the foreseeable future, so I want one I can use in my apartment and on the road. In the end, basic performance and usability for me outweigh other considerations like neat features, band coverage, tiny size, etc. I suspect that the intermod on the VX-5 is because it has a wide front end to receive all of the other spectrum.

The question I would pose to the group is - Is HRO correct, or can you recommend an HT for 2 meters (and 440 would be nice) that is nearly bulletproof on intermod and does not have any big flaws? I am willing to trade features, battery life, small size, et al for basic usability and performance on 2 meters.

Thanks!

David

7359. Laptops, 2m All-mode rig, plus more for SALE/TRADE

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-30 00:00:00 UTC
From: mikrounit@hughes.net
Message-ID: <37799ea8.19529906@news.hughes.net>
Source record: 104760

Hello All,

I have the following for Sale or Trade:

A) 2 Dell 325SLi 3x86 Laptops, VGA display, 120 MB harddrive, battery.
Both are 8.5-9 out of 10 Physical shape & 10 of 10 working condition.

B) Dell 320N+ 3x86 Laptop, VGA Display, 170 MB Harddrive, battery,
modem, touch mouse, & real nice Dell case. The monitor does not seem
to light up when I turn it on, but if I plug an external monitor into
it, it works fine.

C) Kenwood TR-9000 2m All-Mode Transceiver, digital red LED readout
display, modes: FM/USB/CW/LSB, RIT, NB, 2 VFOs, Memory Channels,
Analog S-Meter/Power meter, and I do have the service manual.
It is 8 out of 10 physical condition and 10 of 10 working condition.

D) 24X NEC CD-Rom Drive, may need work, hardly used.

E) 49 Vacuum Tubes

F) Heathkit SA-2060 HF Antenna Tuner, up to 2KW, Roller inductor, Nice
big knobs that gives you ease while tuning you antenna, for
Balaned/Unbalanced line, tunes single wire (Long wire), coax, or
Dual-Input (Ladder line and Twin lead). Has 3 coaxial input switch.

If you are interested in any of these, please E-mail me or call me.

E-mail: mikrounit@hughes.net

Phone: (661) 272-6949

Thanks & 73,

Roger:
The 751A is a great rig. I have had a 740 (not the 745) and have had a 751A now for abt 4 yrs and its a very nice rig...i have had to do a couple of minor fixes on it, but it is an easy radio to work on and very solid. Let me know via email if you need more info. I am not that familiar with the 745, it might be newer than the 751A...

7368. For Sale - CSI Model 9800 MicroPatch (Autopatch/Controller)

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-30 00:00:00 UTC
From: wa4vrv@srv.net
Message-ID: <377a110f.718999@news.srv.net>
Source record: 104769

Hi and thanks for reading this posting.

I had originally sold this unit, but the deal fell through, so I am reposting it.

I have a CSI 9800 MicroPatch (with the optional 9801 Electric Voice Delay option which costs $139.95) that is in excellent condition. It has a small wear mark on the paint on the top of the case. Electrically, it is in excellent condition.

This is an autopatch with 90 dialing memories as well as a repeater controller. This is a full-duplex or simplex autopatch. It is very similar to the CSI 800 (which goes for $359.95 without the optional 9801). Too many features to go into, but you can visit the CSI home page and see what it does.

The URL is http://www.connectsystems.com/cs9800d.htm.

The only reason for selling this is that we purchased a CAT-300 and it does what we need. We never used the full features of this MicroPatch.

Original cost was just under $600.00. Will sell for $300.00 shipped in the U.S.

Email or call.

Just apply for a new TIN from the IRS and use that when they [FCC]
wants your SSN. Say you are working under your name and your new TIN
will be listed under your name vs under a business.

Reg, you're not stupid so why insist on being ignorant???
Have you NO knowledge of history? Even that of this century?

How many despots did dear old England have to endure for centuries before the populace rose up and demanded some resemblence of humane treatment? How long did we "North Americans" try to ignore the Nazi threat, stay out of it and let your "nature" take it's course before we came to realize that the threat was not just to those on the other side of the pond? How many repeats -of history- does it take to drum some sort of knowledge into any human? Fortunately not an infinite number for some of us. Not so sure about you.

We have learned that the undesirable traits in human nature tend to try to dominate the desirable-so we must remain eternally vigilant so that the Hitlers, Stalins, Pol Pots et al are nipped in the bud, and not at the cost of millions of innocent lives.

Yes--Milosevich, too, is an "educated man". So what does that help?
Did he "rob" anyone???

73, Dick

Evidently you don't know anything of economics or the workings of a capitalistic economy... Money MUST be spent for the economy to survive, and LOTS of money must be spent for it to grow.

From college economics of the 60's, I recall that "a dollar spent generates seven dollars" by the time it has circulates through the economy. Who knows what that figure is now? We MUST have huge spending projects such as the B2 bomber at a $billion per copy and other huge spending projects which integrate "high tech" into--and keep it in-- our everyday economy in order for the economic expansion required --no, DEMANDED-- today to endure. Examples are HDTV, the personal communications explosion and Star Wars, to name a few. Forget giveaways to foreign countries, tho it's sure they will continue unabated, but those dollars do nothing for OUR economy. The dollars spent HERE are what counts.

So why do US citizens refer to themselves as 'americans' ?

They do not yet own the whole continent.

After all, Cubans are americans.

The salesperson was right more or less. You need a Inter intermod filter.
check out: Par Electronics - Amateur Radio Filters
http://www.rf-filters.com/filterham.html
http://www.rf-filters.com/
and MFJ-713 2 Meter HT Intermod Filter ot MFJ-714 2 Meter Mobile Intermod
Filter
http://www.mfjenterprises.com/filters/mfj713.html

It does help. The new HT's usually the more the bands more the mod.

Hi,
I'm looking for Three 'hard to find' electronic parts.
They are:

Hitachi 3sk309
Motorolla MRF9820T1
HP HSCH-9161

Can anyone suggest where the best www site is to
buy these items?

Thanks in advance.

7387. VX-5R Data cable

Newsgroup: rec.radio.amateur.equipment

DOes anyone know where I can either buy or order a data cable for modifying my VX-5R? Also, is software mods better than hardware? I have the latest version of "EVE". Is this what I should use?

You can find this cable just about anywhere. It is the same cable
used for the VX-1R or the FT-50. Check the ham radio outlets around
the country for availablity.

The software mod is very easy to perform and the major advantage of
this is that it does NOT void your warranty. It took me a few minutes
to figure out how to use the EVE software, but I can confirm that it
does indeed work. I find myself using it more than I originally thought.

Best of luck
Gary

Speaking as a total idiot when it comes to economics: What kind of BULL is that? Inflation aside, as far as I know, wealth is not created or destroyed, just redistributed. With a trade deficit, the only meaning I can infer from your statement is that each dollar inflates 700% by the time someone gives it back in taxes.

This doesn't feel right, so please explain.

Michael.

David-

This is precisely correct. The only handheld transceiver I know of that is substantially better, is the Radio Shack HTX-202.

I agree with Lou WA8PHD, that an intermod filter may be your best alternative, assuming it would cost less than a new radio. Of course you would need a separate filter for each band, and have to swap them manually.

In addition to the MFJ filters, I find filters by Par Electronics and DCI Digital Communications, listed in the Amateur Electronic Supply catalog. They also list an Oak Bay Technologies low pass filter for use up to 54 MHz.

Lance: I have spent well over $100.00 in search of the "best" antenna for my FT-50 an here is what I have found: For overall best performance and rugged service--the antenna for the Kenwood TH-G71A hand held. I use this as THE main antenna! The next best antenna is the Comet SM-24 whip, but it is delicate at the base and you can poke your eye or someone elses who is seated when you walk by them with it on your belt, say in a resturant. I use this alot when I am skiing or hunting as the antenna is very flexible and bends with my body contour when I have it in a chest pouch, or jacket breast pocket (just stick the whip up through the epaulettes on my field jacket). Comet Miracle Baby with the BNC/SMA adaptor. Work good for x-band repeat to you mobile or around you house repeater or close repeaters. Works better than the stubby for SMA, which looks better, but does not perform as well as the original Miracle Baby. I tried a couple of other Comet antennas, but broke one right at the "bullet" and the other is about ready to break at the whip/load juntion. My Icom IC-32AT BNC antenna works very well also, but requires an SMA adaptor. For all around good gain and rugged use--get the Kenwood antenna. You may have to tighten up the center conductor on the rig's sma mount because the Comet center was larger than the Kenwood. Rudy, K8SWD

Tried the Diamonds. They are cute. About the same as the Comets. Both
brands will break at the "bullet" when they have been bent several times. I
was surprised at how long mine lasted. I have had my Kenwood antenna on my
FT-50 for over a year, use it daily, and abuse the crap out of it. Still
looks new. K8SWD

I agree with Fred the carrier crystal for cw is either off freq or not oscillating. if you have a general coverage receiver setting near the rig and tune for the crystal freq you should be able to hear it. try SSB crystal freq first as a test.
good luck
Don

Hi:

I'm asking for a friend, the book does not belong to me nor do I intend on buying it. Can anyone tell me the going rate for a 1926 1st Edition ARRL Handbook in excellent condition. The only flaw I noticed was at the bottom of the spline where there was about a 3/8" flap of the cover turned up.

I intend on passing along any info provided to the owner and if she is interested in selling I will post her asking price.

Bill

========================
So why do US citizens refer to themselves as 'americans' ?

They do not yet own the whole continent.

After all, Cubans are americans.

U.S. citizens? The proper name of the country is the United States of
America. How they refer to themselves is irrelevant. Your implication that
all use this moniker and that by this use there are no other Americans
outside of the USA is silly

You forgot Canada (which by the way has far more land mass than the USA),
all the various sovereign Indian nations, Haiti, and Costa Rica to name a
few.

Keep trying, you'll eventually get it.

One thing you can try for things like HP and Motorola is to go to their web sites and see if they point to distributors. A lot of distributors now take small credit card orders, though many do still have a minimum, or a minimum shipping charge that could cause some pain.

I'd think that most folk here would already know about Mouser and DigiKey, and there are a few other places that have things like "replacement parts" in the Japanese transistor series. There are also a couple places at least that specialize in RF semiconductors (both low and high power). Do a web search? Look in the ads in magazines like "Electronics Now"? Maybe someone will post some favorites.

I know that answer is kinda vague but maybe it'll get someone pointed in a direction that leads somewhere.

Cheers,
Tom

7425. FT-102 11 meter fixes

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-30 00:00:00 UTC
From: Carmine Iannace KA2PAP <iannace@mediaone.net>
Message-ID: <COze3.1770$kL2.137895@ndnws01.ne.mediaone.net>
Source record: 104826

I have a Yaesu FT-102 that I just got a hold of. The unit is in fine shape except for the fact that the 29 MHz band position has been modified to work on 27 MHz (CB). The readout shows 29 MHz but the TX/RX occur at 27 MHz. I recently purchased the FT-102 Technical Supplement and it includes a section on 11 meter modifications but those pages seem to have been removed by Yaesu. Does anyone know of how to reverse this 11 meter modification and of any other FT-102 mods in general?

Thanks,

Carmine KA2PAP

7431. Need Icom Mod????

Newsgroup: rec.radio.amateur.equipment
Date: 1999-06-30 00:00:00 UTC
From: Pat Johannik <kf6bbd@raisin.com>
Message-ID: <9NBe3.810$mq2.78016@typhoon-sf.snfc21.pbi.net>
Source record: 104832

Hello,

I am in need of the mod to extend the transmit on the Icom IC-T42A.

If anybody has this info it would be greatly appreciated. I am told that the mod is the same as the VHF model. I do not have this mod either. I have looked all over the net but have not found any. Again, any help would be greatfull. Please resopnd back via email.

kf6bbd@raisin.com

Thanks Again,
Pat

7432. FS: 6 WWII Military Tubes, New In Original Boxes

Chuckle. So are our fine and justly proud brothers the Canadians. But call one an "American" some time and note the reaction you get.

Thanks for all the suggestions. I did get it to work and it was the com settings. I was using the adapter cable and was trying to get the template. But those darn com settings have to match.

Make sure your COM port set-up is correct. This caused me some problems. I finally called tech support at RT Systems and they helped me get it squared away. You may have to change the Port/IRQ/Input-Output Range settings to find one that matches the ADMS port settings. Go to Control Panel then System then Device Manager and double click "Ports". Highlight the Com port you have the cable connected to and click Properties and then Resources. Windows will assign some pretty strange combinations sometimes, but you can change these settings manually. (i.e. Com 4/IRQ3/Input-Output Range 02E8 - 02EF) Be careful not to change the port settings for your modem or other attached peripheral. You'll end up having to reinstall things if you do. This may get you to the point where the radio and the computer can start talking. If you are successful, create a template file first thing from the radio and then you should be all set.
Oh yeah, don't forget the four conductor cable that connects to the three conductor cable for your radio. Won't work ever if you don't have this in place.
Hope this helps

I'm having the same trouble as well. I know I must get a template from the radio first but I can't get that far.
Is it a squelch setting?
Thanks.

Help with AMPLIFIER Problem

I have just aquired a SB-220 Amplifier and when I put the RELAY keying circuit from the radio, it keys the relay in the amplifier and cuts the recieve in half or much less. I unplug it and it receives normal...

Any answers how to fix it... Even if the rig is off it stays keyed in the amp.

John
